the 2011-2014 activity  
report sent to the French  
National Research  
Agency<sup>1</sup> in charge of  
the monitoring of LabEx  
programs.*

<sup>1</sup> [www.agence-nationale-recherche.fr/en/about-anr/investments-for-the-future/](http://www.agence-nationale-recherche.fr/en/about-anr/investments-for-the-future/)

# 1. Increasing imaging needs

## TODAY, LABEX TRAIL HAS 23 COLLABORATIVE AND TRANSLATIONAL RESEARCH PROJECTS

### a) Public health issues

Cancer, cardiovascular, respiratory and neurological diseases are major public health issues. According to the World Health Organization (WHO, annex 1), 17 million people die each year of cardiovascular disease (heart attacks, strokes), 8.2 million die of cancer (lung, colon, breast, stomach, liver), 6.2 million die from respiratory diseases (lower respiratory tract infections, chronic obstructive pulmonary disease), and 6.8 million die after suffering neurological disorders (Alzheimer, Parkinson, MS, neuroinfection). The aging of the population (27% over 65 years in Europe in 2040 versus 18% today) and the evolution of environmental factors go hand in hand with an increased risk of these diseases.

These public health risks and their economic impact - cost of medical care, work stoppage cost - are attracting the attention of public policymakers and will increase the need for prevention, diagnosis and personalized therapeutic monitoring.

Medical imaging plays a central role in meeting public health challenges. From a medical point of view, imaging provides an earlier, faster and more accurate diagnosis, as well as optimal therapeutic management adapted to the biology and genome of the patient. It also allows a more targeted drug delivery, better monitoring of the effectiveness of treatment and less invasive surgery because of the guidance it provides. From an economic point of view, imaging optimizes care costs thanks to early diagnosis, optimal treatment and a shorter recovery time. It is also a source of industrial competitiveness.

### b) Translational Research

Effective transfer of the new knowledge, mechanisms, and techniques generated by advances in basic science research into new approaches for the prevention, diagnosis, and treatment of disease is essential for improving health.

The first step of translational research (T1) refers to the bench to bedside enterprise up to the first testing in humans: basic research in biology, bio-medicine, physics, mathematics, computer science, chemistry.

This step should ideally be followed by the transfer of results from clinical studies into everyday clinical practice and health decision making (T2): costs (global budget crisis), chronic diseases, aging, personalizing medicine, quality insurance, safety.

The development of imaging involves several areas of expertise (physics, chemistry, information technology, mathematics, biology, pre-clinical, clinical, medical,...) through a trans-disciplinary approach. Thus, imaging translational research aims at:

- › Improving diagnosis by in vivo characterizing of cellular and molecular mechanisms (bio-markers in bio-imaging) in personalized medicine
- › Monitoring treatments or target delivery of therapeutic agents and performing longitudinal evaluation of targeted therapies
- › Developing image guided therapy: interventional radiology for surgery substitution, drug or gene delivery
- › Developing surrogate marker for therapeutic trials
- › Personalizing patient care
- › Exploring large cohorts and populations to better understand diseases
- › Attracting medical industries to create health, wealth and employment
- › Transferring technology

### c) "TRAIL, Translational Advanced Imaging Laboratory"

In this context of major public health issues and growing needs in medical imaging, research in Bordeaux offers 2 advantages: multidisciplinary, which is specific to its community, and the co-involvement of teams around structuring projects.

In 2008, the medical imaging research teams in Bordeaux pooled their expertise in several fields and created the Institute of Bio-Imaging called "IBIO". For its development, the IBIO Institute received financial support from the 2007-2013 State-Region Project Contract<sup>2</sup>: a 4M€ subsidy for equipment and an 8M€ grant for a new building.

In 2011, the University centralized the management of its imaging research equipment on the CNRS-UMS-3428 technological platform. This platform includes 3 human/large animal MRI (0,2T; 3T; 3T), 3 small animal MRI (4,7T; 7,05T; 9,4T), 1PET-CT, 2 focused ultrasound systems and 6 optical systems.

In 2012, The Bordeaux site became the «regional node» for the «France Life Imaging»<sup>3</sup> «national bio-imaging research infrastructure and received a proportionate share of funding to the tune of 3.7M€.

Meanwhile, the University of Bordeaux created an International Bioimaging Master's Program in 2011 (annex 2) in partnership with the University of Mons (Belgium) and Laval (Quebec). It had 15 students in 2013 and 10 in 2014.

In a context of globalization, the French government decided in 2009 to launch a «large loan» in order to raise funds for massive investments in research and innovation. This «investment program for the future»<sup>4</sup>, with 47bn€, including 12bn€ for public research purposes, takes the form of calls for national proposals to select innovative projects with high growth potential. 7bn€ will be dedicated to financing «Initiatives of Excellence» (IdEx), which will create poles of higher education and research at international and multidisciplinary level. 1.9bn€ will fund the deployment of «Laboratories of Excellence» (LabEx) and 800M€ will be used for "Equipment of Excellence" (EquipEx).

The IBIO Bioimaging Institute - supported by the University of Bordeaux, the CNRS, the CEA, the INSERM, the University Hospital of Bordeaux and the Cancer Institute of Bordeaux - was a candidate in the first round of the «Laboratory of Excellence» program (LabEx) in 2010, and submitted the «TRAIL» project. Teams worked for a year to define a site project and enhance the areas of expertise of the community. The «TRAIL» project was awarded in July 2011. From all scientific fields, TRAIL ranked 57th out of 100 elected Laboratories of Excellence, and received funding of 9M€ for 9 years of development (2011-2019). «TRAIL» became the only medical imaging LabEx in France. It is part of the «investment programs for the future» portfolio of the University of Bordeaux and the «Initiatives of Excellence» program (IdEx Bordeaux) which was also awarded in 2011<sup>5</sup>.

The group of founders of LabEx TRAIL consists in seven core partners; one partner left Bordeaux and 2 new partners entered the group in 2013, bringing to eight the number of units<sup>6</sup>, which are A+/A only (AERES<sup>7</sup> 2011):

- › The Institute of Molecular Sciences (ISM, UMR5255)
- › The Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536)
- › The Bordeaux Cardio-Thoracic Research Centre (CRCTB, U1045)
- › The "Physiopathology of neuronal plasticity" Inserm unit (Magendie Institute, U862)
- › The Aquitaine Institute of Cognitive and Integrative Neurosciences (INCIA, UMR5287)
- › The Neurofunctional Imaging Group (GIN, UMR5296)
- › The Bordeaux Institute of Mathematics (IMB, UMR5251)
- › The "Neuroinflammation, imaging and therapy of multiple sclerosis" Inserm unit (U1049)

These research teams focus on six main objectives:

- › Improving imaging science
- › Developing translational research
- › Evaluating medical and economic impacts
- › Interacting with the industry
- › Promoting training
- › Establishing strong governance

They aim at developing a research portfolio that addresses major health themes:

- › Neurology
- › Oncology
- › Cardiology
- › Pulmonology
- › Nephrology

Benefiting from the multidisciplinary approach in Bordeaux, seven work packages were proposed:

- › Interventional imaging
- › New imaging sequences
- › Dynamic Nuclear Polarization
- › Tracers and contrast agents
- › Biological bio-imaging markers
- › Mathematical simulation and modeling
- › Cohort imaging methodology

Researchers have access to two state-of-the-art imaging platforms in Bordeaux:

- › UMS-CNRS-3428: Biomedical science imaging platform (annex 4), University of Bordeaux, in association with the University Hospital Pellegrin
- › PTIB: Biomedical Innovation Technological Platform<sup>8</sup>, University of Bordeaux, in link association with the South University Hospital

# 2. 2011–2014

## achievements

### a) Governance

The governance of LabEx TRAIL is formalized by a Consortium Agreement signed by all five institutional trustees<sup>9</sup>.

#### **Board of Trustees:**

- › 5 members: University of Bordeaux, CNRS, INSERM, CEA, INP
- › Role: the Board of Trustees oversees the development of the LabEx, checks the adequacy between objectives and strategy

#### **Steering Committee:**

- › 14 members: 8 representatives of laboratories, 5 representatives of thematic axes and the Director, who chairs the committee (see annex 5 for members names)
- › Role: members of the Steering Committee meet monthly to define the development strategy, collaborative actions, guidelines of calls for proposals, and to discuss the budget

#### **Director/ANR coordinator:**

- › TRAIL Director is Pr Vincent Dousset; he is the "Coordinator" of the TRAIL program for the ANR
- › Role: the Director is in charge of the development of the LabEx, the coordination of 8 core partners, and the collaboration with all partners; he liaises with the Board of Trustees and IdEx Bordeaux and does an annual reporting to the ANR, to IdEx Bordeaux (annex 6) and to the Board of Trustees when necessary

#### **Evaluation Committee:**

- › 2 Members: 2 regional scientists independent from TRAIL
- › Role: the Evaluation Committee evaluates scientific projects that were submitted to TRAIL calls and recommends projects to be granted on the basis of external scientific reviews

#### **Administrative Staff:**

- › The administrative team is composed by the General Manager and the Scientific Animation Coordinator
- › Role: the administrative team sets up procedures for calls for proposals, implements development actions, promotes the LabEx, organizes scientific animation, manages the budget in collaboration with the financial teams of the University of Bordeaux, and does the reporting to the Director, to the Steering Committee, to IdEx Bordeaux, and to the ANR under the supervision of TRAIL's Director

<sup>9</sup> University of Bordeaux, CNRS, INSERM, CEA, INP

## b) Research projects

### b.1) Internal call procedure

Research projects were selected through procedures for calls for proposals:

- › Emerging calls support new projects looking to fund a proof of concept (18 months of funding, 35,000€ maximum)
- › Federative calls concern advanced projects that are seeking to accelerate cross-sectional research (36 to 48 months of funding, 200,000€ maximum)
- › Doctoral Fellowship calls and Postdoc calls allow the recruitment of a Doc/Postdoc to extend the development of an already awarded project (24 to 36 months of funding, 100,000€ maximum)
- › Consolidation calls concern already granted projects that propose to broaden their research themes (70,000€ maximum)

The funding from TRAIL aims at financing human resources costs and running costs. Financial support for equipment is limited to 15,000€ per project.

For each emerging or federative research project, the proposal was analyzed by 2 international scientific reviewers<sup>10</sup> who assessed the scientific originality of the project, the quality of the team and the development plan. Their reviews were given to the Evaluation Committee, which recommended a selection of projects to the Director of TRAIL.

For Postdoc calls and Consolidation calls, the Steering Committee members selected the projects to be granted.

For the monitoring of the program, the project leader of each research project reported the achievements of his/her research as follows:

- › An annual written report describing the scientific developments, recruitments, academic and industrial collaborations, publications, distinctions and awards, dissemination of knowledge, co-financing plans and budget
- › An oral scientific presentation during the annual General Assembly

From 2011 to 2014, the LabEx organized 9 calls that funded 23 research projects for a total budget of 3,164M€<sup>11</sup>:

- › In **2011**: 5 federative projects, for a total budget of 494K€
- › In **2012**: 4 federative projects and 5 emerging projects for a total budget of 1151K€
- › In **2013**: 4 federative projects, 2 emerging projects and 2 PhD funding for a total budget of 894K€
- › In **2014**: 4 consolidated projects, 3 emerging projects and 3 PhD funding for a total budget of 625K€

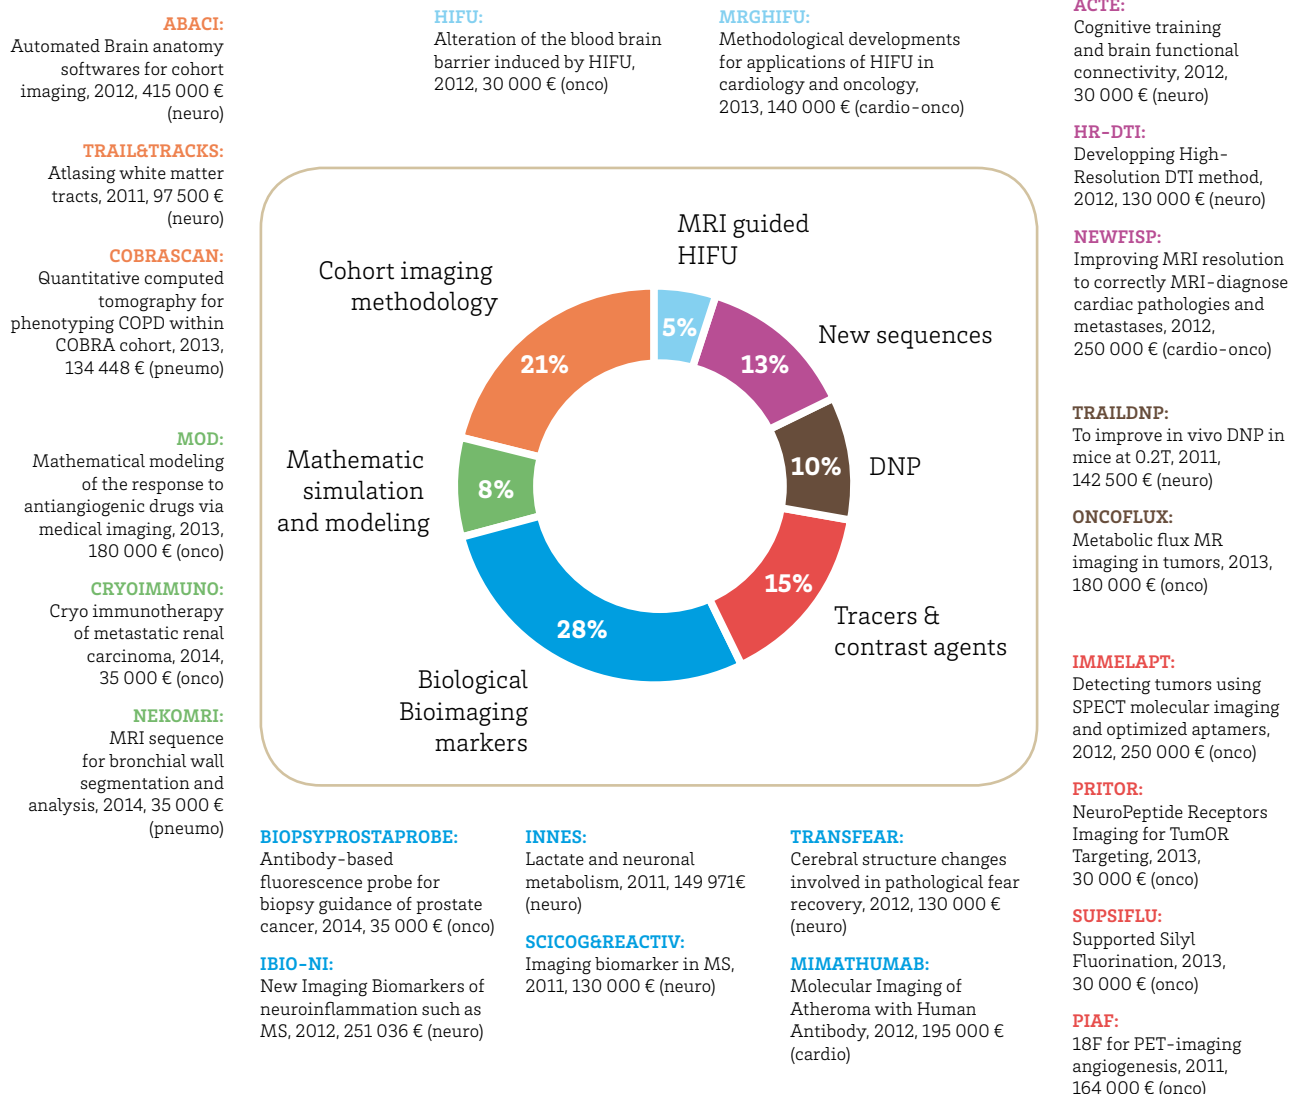

<sup>10</sup> 48 reviewers: see annex 7 for names of organizations they belong to

<sup>11</sup> more detailed budgets in annex 8

	MRI guided HIFU	New sequences	DNP	Tracers & contrast agents	Biological Bio-imaging markers	Mathematic simulation and modeling	Cohort imaging methodology

	5%	13%	10%	15%	28%	8%	20%	100%	

## b.2) Selected research projects

By the end of 2014, the TRAIL research portfolio was composed of the following projects (see annex A for abstracts of projects):

## b.3) Results at a glance<sup>12</sup>

Concerning the fields of research of the LabEx, TRAIL researchers have published 202 publications<sup>13</sup> in peer-reviewed journals since 2012 and they have given 150 scientific communications in national and international events:

- Publications: American Journal of Respiratory and Critical Care Medicine, Angewandte Chemie, Brain Structure and Function, European Journal of Nuclear Medicine and Molecular Imaging, Journal of Allergy and Clinical Immunology, Journal of the Alzheimer's Association, Nature, NeuroImage, Neurology, Neuron, Radiology, Science, ... (annex B)
- Scientific communications: ACTRIMS-ECTRIMS, EuroGlia, Gordon Conference, IEEE International Conference on

Image Processing, International Symposium on therapeutic ultrasound, ISBI, ISMRM, MICCAI, Organization for Human Brain Mapping, ... (annex B)

18 new collaborators and 8 trainees joined a community of about 170 people (annex 10):

- 3 postdoctoral fellowships (from France and Italy)
- 2 engineers
- 7 doctoral students (from Australia, Canada, France)
- 8 trainees
- 2 administrative staff for the operational management of the LabEx
- 4 visiting professors<sup>14</sup>

36 academic research collaborations have been established (annex 11):

- 21 international academic collaborations: Washington, Verona, Sherbrooke, Valencia, Bicams network, Magnims network, Amsterdam, New York, Royal Holloway London, Lausanne, Melbourne, Utah, Wisconsin, New Delhi, Ferrara, ...
- 12 national academic collaborations (Grenoble, Lyon, Marseille, Paris, Toulouse, Dijon...)

<sup>12</sup> See annex 9 for a comparison between TRAIL objectives and 2011-14 results

<sup>13</sup> 56 publications in journals which impact factor is superior to 5; 11 publications in journals which impact factor is superior to 10

<sup>14</sup> TRAIL teams were granted by IdEx program with 4 visiting professors who joined the LabEx for a short period (2-3 months): C Guttmann, Harvard; D Parker, University of Utah; AK Mishra, New Delhi; T Skrydstrup, University of Aarhus

15 manufacturers are involved in TRAIL research projects<sup>15</sup> :

- › AFFICHEM: development of radiotracers
- › BRUKER: sequence development and magnetic particle imaging
- › CADESIS: database management for cohort imaging
- › GLAXOSMITHKLINE: drug testing and validation of treatment for cancer diseases
- › IBA MOLECULAR: development of radiotracers
- › IGT SA: HIFU application development for cardiology and oncology
- › INTRASENSE: post-processing software engineering
- › LFB BIOTECHNOLOGIES : antibodies engineering
- › MERKSERONO: neuroinflammation clinical studies
- › NOVAPTECH: aptamer-based tools
- › PHILIPS: technological support for high resolution MRI sequence development
- › SANOFI: Alzheimer biomarkers
- › SIEMENS: engineer time for oncology imaging
- › TEVA: neuroinflammation clinical studies
- › UNITHER PHARMA: development of an analgesic

A total of 6.2M€ of public and industrial co-funding reinforced TRAIL research projects (annex 12):

- › 5.644M€ of public co-funding: ANR programs, ARSEP, French State, Doctoral School, European FP7 programs, INSERM, ISHARE,...
- › 0.551M€ of industrial co-funding, not including technical and engineering support: IBA MOLECULAR, INTRASENSE, MERK SERONO, TEVA, UNITHER

#### **b.4) Scientific results per work package**

See annex C for main scientific results and orientations per work package

<sup>15</sup> If needed, AST - the technological transfer agency - represents the trustees (University of Bordeaux, CEA, CNRS, Inserm, INP) for intellectual property rights negotiations with industrials ([ast-innovations.com](http://ast-innovations.com))

#### **c) Scientific animation**

The LabEx TRAIL has organized 15 scientific events in Bordeaux (annex 13):

- › 1 translational imaging meeting about "image guided therapy and diagnosis" welcoming 6 international speakers (50 participants)
- › 8 translational imaging conferences between 2013 and 2014 (200 participants)
- › 1 summer school, co-organized with the Neurofunctional Imaging Group: «Connectomics: the wiring diagram of the human brain», September 2014 (40 participants, annex 14)
- › 2 seminars: «MRI contrast modulation» seminar (13 participants) in partnership with the University of Mons (Belgium); Neuro-Glia Interactions symposium (50 participants)
- › 1 mentoring action: a twelve-month outgoing mobility at Stanford for 1 researcher working on MS imaging
- › 2 knowledge dissemination actions: participation at the exhibition «CERVORAMA: Explore your brain and those of animals» in Cap Sciences, Bordeaux, in 2012 (62,000 visitors in 1 year), and a publication in the magazine «Chercheurs d'Aquitaine»

## d) Snapshot of strengths and weaknesses by the end of 2014

### d.1) Strengths for developing competitive research

Research themes	› TRAIL research projects concern major public health issues in neurology, cardiology, oncology, pneumology, and nephrology
Teams	› Multidisciplinarity on the same site: imaging, physics, biology, chemistry, mathematics, computer science › Collaboration between clinicians and researchers to develop targeted translational research › Large community of 170 people <sup>16</sup> › A+/A only teams (AERES 2011)
Equipment	› 2 up-to-date technological platforms supported by France Life Imaging national network › 2 dedicated buildings: IBIO (2014), IHU LIRYC (2015)
Budget	› A remaining budget of 5M€ for the 2015-2019 period

### d.2) Strengths for unifying the community and widening visibility

Governance	› Consortium Agreement signed by all five institutional trustees <sup>17</sup> › Monthly meetings of the Steering Committee since 2011 › Two dedicated administrative staff
Supports	› IdEx Bordeaux support <sup>18</sup> : InterLabEx research program, thesis funding program, summer school co-financing, international visiting professor program, communication and management collaborations › Support from Conseil Régional d'Aquitaine: IBIO building and equipments co-funding

### d.3) Weaknesses in developing competitive research

Research themes	› Competitive themes on international level › Scattered themes of research as result of multiple work packages and medical fields: 23 research projects financed
Equipment	› High investment and operating costs of imaging equipment

### d.4) Weaknesses in unifying the community and widening visibility

External growth	› No national or international teams settling in Bordeaux › Weak regional and national industrial imaging scene › Limited technological transfer opportunities as projects show – so far – low Transfer Readiness Level
-----------------	---

<sup>16</sup> 86 researchers, 17 postdocs, 25 engineers, 24 doctoral students, 8 technicians, 10 administrative staff

<sup>17</sup> University of Bordeaux, CNRS, INSERM, CEA, INP

<sup>18</sup> IdEx Bordeaux cofounded following research and education projects: LabEx TRAIL – LabEx CPU research program (134,000€), one thesis (49,000€), Connectomics summerschool (15,000€), 4 visiting professors

# 3. 2015–2019

## strategy

### a) Development strategy

The Steering Committee has decided to:

› **Strengthen already running research projects:**

- "Consolidation Program" dedicated to support already awarded research projects
- Co-funding of the renewal of a 3T research MRI by paying for MRI time

› **Develop external growth:**

- Building a network of international researchers on translational research
- Increased capacity of IBIO and IHU LIRYC: the IBIO building will enable the installation of 3 new MRI<sup>19</sup> and provide 750m<sup>2</sup> for welcoming new teams and spinoff companies; the new IHU LIRYC building will reinforce multidisciplinary research in cardiac pathologies (annex 15)
- Incentives for submitting to H2020 calls and for participating to LifeKic Consortium (annex 16)
- Incentives for creating a "IAL" (International Associated Laboratory)<sup>20</sup>

- Set up of an international host program

- Participation in the «visiting professor» program from IdEx Bordeaux

- Reinforcement of scientific dissemination: international speakers invited to Bordeaux, summer school "Imaging of neuroinflammation" (annex 17), scientific animation specific to each work package, etc

<sup>19</sup> Two small animals MRI and one 3T MRI

<sup>20</sup> Scientific collaboration between a TRAIL core partner and a foreign laboratory jointly working on a research project and sharing human resources and equipment

## b) Provisional budget

Financial strategy has been set up as follows:

TRAIL OBJECTIVES	STRATEGY	PROGRAM	DECISION BOARD	2015-2019 BUDGET
WORKING ON MAJOR PUBLIC HEALTH ISSUES	Showing importance of TRAIL research to society and scientific community		Steering Committee	- €
DEVELOPING COMPETITIVE RESEARCH	Boosting existing research projects	Doctoral fellowship program	Steering Committee	400 000 €
		Post-doctoral fellowship program	Steering Committee	700 000 €
		Research projects consolidation program	Steering Committee	1 060 000 €
		Doctoral support program	Steering Committee	40 000 €
	Supporting new research projects	Federative and emerging research program	Steering Committee, Reviewers, Evaluation Committee	1 180 000 €
	Taking a strategical collective action	MRI time purchase program	Steering Committee	420 000 €
UNIFYING THE COMMUNITY AND STRENGTHENING INTERNATIONAL VISIBILITY	Multidisciplinarity of the community	Summerschool, training	Steering Committee	200 000 €
	Organizing the scientific animation	International speakers lectures and scientific events program	Steering Committee	45 000 €
	Administrating the cluster	Internal calls management, teams coordination, participating to Idex programs, promoting the cluster, reporting	Steering Committee, administrative teams	523 000 €
	Reinforcing attractiveness	International program (associate team, visiting scholars, mobility)	Steering Committee	450 000 €
		IdEx programs participation	Steering Committee	- €
			TOTAL	5 018 000 €

## ◆ HIFU

### High-Intensity Focused Ultrasound

#### Oncology

Klaus Petry, the  
"Neuroinflammation, imaging  
and therapy of multiple sclerosis"  
 Inserm unit U1049, 2012

TRAIL funding: 30 000 €

Passage of the blood brain barrier (BBB) is essential for effective drug delivery into the central nervous system. High-Intensity Focused Ultrasound (HIFU) has shown promising for non-invasive and focal opening of the BBB. Very limited, however, is the understanding of the underlying cellular and molecular mechanisms at the BBB, in particular of the endothelial cells being involved in such HIFU induced opening and eventually induced unwanted side effects. By in vitro studies of the BBB model (hCMEC/D3 cell line) under HIFU we will investigate the cellular and molecular dependent transports (clathrin, caveolin, tight junctions) and their specific inhibitions. In vivo studies of focally HIFU induced BBB alteration and histopathological evaluation and molecular expression studies of endothelial cells will validate the defined activated cellular and molecular transports. Histopathological studies will evaluate eventual non desired side effects of BBB opening and in adjacent CNS parenchyma due to the focal HIFU application. A portable HIFU system in application to small cell cultures and in vivo studies has been locally developed in partnership with Image Guided Therapy SA (Pessac, France) and in collaboration with TRAIL

## ◆ MRGHIFU

### Methodological developments for preclinical and clinical applications of MR guided HIFU

#### Oncology-cardiology

Bruno Quesson, the Bordeaux  
Cardio-Thoracic Research Centre  
(CRCTB, U1045), 2013

TRAIL funding: 140 000 €

The possibility to locally deposit thermal and mechanical energy in a non-invasive way with focused ultrasound (High Intensity Focused Ultrasound - HIFU) has opened new possibilities for the development of innovative therapies with improved reliability and reduced associated trauma (Ter Haar et al, 2012). In the last decade, real-time imaging (ultrasound (US) and Magnetic Resonance (MR)) methods have been developed to characterize ultrasound propagation in living tissues and to measure and control the local heat deposition. The aim of the present project is to develop new methods for MR guided HIFU by exploiting the hardware platform installed in Bordeaux. This project builds on the deep knowledge in real time guidance of MR guided HIFU effects to reinforce fundamental research in cardiology and oncology and to facilitate translation toward clinical application. This proposal associates several academic teams (INSERM, CNRS) in Physics and Biology, clinicians (Anti Cancer Center Bergonié), one international collaborative team (Univ. Salt lake City) and receives the support of a local company specialized in MR guided HIFU instrumentation and methods (Image Guided Therapy SA).

The project is structured in four work packages, including methodological developments of MR monitoring methods (WP 1), new HIFU sonication strategies (WP 2), in vivo characterization on small animal models of the interaction between HIFU and biological tissues (WP 3) and preclinical evaluation and optimization of a dedicated breast MRgHIFU platform (WP 4). This project receives important co-financing and requests funding for additional human resources. The objective is to improve the synergy between the different scientific objectives of the research community (fundamental research, cardiology and oncology) and should benefit to other research teams for future applications. The direct implication of a local company (IGT SA) reinforces the immediate collaboration between each research team and aims to facilitate technological transfer and emergence of new products and applications (each site being equipped with similar MRI scanners (Siemens) and all HIFU devices being designed by IGT SA), with the aim to shorten the time scale between technical advances, fundamental research and clinical applications.

## 2/ Work package “NEW SEQUENCES”

### ◆ ACTE

#### Ambulatory cognitive training in elderly: Relation with intrinsic brain functional connectivity

Neurology

Sandra Chanraud, the Aquitaine Institute of Cognitive and Integrative Neurosciences (INCIA, UMR5287), 2012

TRAIL funding: 30 000 €

Age-related cognitive decline has multiple brain substrates including compromised integrity of cortical gray matter nodes, white matter connections, and cerebrovascular perfusion. Successful aging involves functional neuroadaptation to accommodate to or compensate for these multi-level changes in brain microstructure and macrostructure and the potential to enhance function with redistribution of resources. Cognitive training from computerized tools holds promise for improving cognitive abilities in cognitively normal, community-dwelling older adults who have a higher risk of cognitive decline, due to a low “cognitive reserve” as they age. Even though benefits on psychological measures of training in elderly have been well documented, little is known on neural substrates underlying this cognitive gain. It is known, however, that frontostriatocerebellar networks underlie changes from controlled to automatic behaviors involved in learning processes launched during task training. Also, functional connectivity of the “default-mode” network (DMN), which is specific to the resting brain, has been revealed to predict task performance after training. Therefore, we propose to identify, in elderly neurophysiological substrates of training-induced plasticity using resting-state connectivity, and functional activation measures together with measures of cognitive efficiency induced via tasks training, using ambulatory and computerized techniques. These studies will

be directed by three overarching hypotheses: 1) training processes will help subjects to establish automatic processes through changes of resting functional connectivity 2) the extent of training-related changes from controlled to automatic processes will be related to functional connectivity changes within and between specific neural networks, i.e., frontostriatocerebellar and defaultmode networks 3) greater anticorrelation between task- and rest- networks will correlate with greater local functional connectivity and better performance.

### ◆ HRDTI

#### High Resolution DTI method

Neurology

Bassem Hiba, the Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536), 2012

TRAIL funding: 130 000 €

Despite its clinical strength, Diffusion Tensor Imaging (DTI) inherently suffers from a limited signal to noise ratio which leads to a low spatial resolution. The limited resolution (2-3 mm) of DTI introduces large partial volume effects which could limit the accuracy of diffusion parameter assessment for small structures of brain (cortical gray matter and small tracks of white matter) and mask changes of diffusion parameters in small pathological lesions. We have developed a high resolution (HR) DTI strategy, based on an optimal acquisition method and on new denoising and interpolation post-processing algorithms. This very promising approach has provided HRDTI data with a submillimeter isotropic resolution (0.4 mm). The aim of this proposal is to optimize the acquisition and post-processing methods and to validate our HR-DTI approach at 3T.

### ◆ NEWFISP

#### Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases

Cardiology

Sylvain Miraux, the Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536), 2012

TRAIL funding: 250 000 €

The goal of this project is: 1) to define the methods to perform MR images with high space and time resolutions, that would provide more quantitative data and thus more information at a local and at a whole-body level, and more adapted to patient imaging. 2) in the short and medium term, and in interaction with the IHU teams, to transfer the breakthrough developed by the RMSB cardio-vascular imaging team from small-animal to human, in order to correctly diagnose cardiac pathologies and accurately guide the therapies. 3) in medium and long term, and in interaction with the oncologists at Bergonie Institute, to develop original approaches to early diagnose metastases by MRI. This project is based on the development and improvement of the MR (b)SSFP sequence (fully balanced Steady State Free Precession). This sequence is already performed on an everyday basis at high magnetic field (4.7T, 7T and 9.4T) at the RMSB. This sequence was also adapted and optimized at clinical field (1.5T and 3T) by one of the co-author of this project. The strength of the development and optimization would allow the use of this sequence on small animals for preclinical studies on pathological models, and also on human to apply this sequence in clinical setting.

### 3/ Work package "DNP"

#### ◆ TRAILDNP

In vivo DNP in mice at 0,2T

*Neurology*

Eric Thiaudiere, the Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536), 2011

TRAIL funding: 142 500 €

The UMR 5536 is nowadays developing an unique double resonance modality, using electron spin resonance for enhancing MRI signal by dynamic polarization. This modality is now running in living mice, with clear contrast enhancement brought by the addition of nitroxides. By the same way, brain tumor locations was revealed by passive retention of free radicals at the tumor site. The proposal aims at hiring a PhD student for improving the method in order to provide high spatial and time resolutions. The work will consist in sequence developments, experiencing animal models and, if possible, hardware developments. The ultimate goal is to perform in vivo DNP-MRI to reveal disease-induced protease activity with chemically designed nitroxides provided by partners.

#### ◆ ONCOFLUX

Metabolic flux MR imaging in tumors

*Oncology*

Yannick Cremillieux, the Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536), 2013

TRAIL funding: 180 000 €

Most tumor cells are characterized by abnormal metabolic pathways to generate energy (as exemplified in the well-known Warburg effect) and to sustain enhanced cell proliferation. This disturbed metabolism is a key hallmark of tumor cell aggressiveness and as a result of prognostic in patients. Importantly, the cancer cell metabolism can vary in time and be highly heterogeneous in a given tumor. Until recently, no single imaging technique was able to provide non-invasive measurements of metabolic fluxes with sufficient spatial resolution and sensitivity. However in the last decade, a new MR imaging tool based on hyperpolarization of C13-labelled metabolites has emerged as a highly sensitive non-invasive metabolic imaging technique. The UMR 5536 is equipped with a unique DNP (Dynamic Nuclear Polarization) apparatus able to dramatically enhance (5 orders of magnitude) the sensitivity of detection of hyperpolarized metabolized substrates with MRI.

The research program ONCOFLUX will aim at the detection and grading of malignant tumors in brain and lungs in animal models, and will focus on the investigation and quantification of the metabolic fluxes in vivo in these tumors. Besides, this research program will establish standardized hyperpolarization procedures and MRS/MRI protocols for in vivo metabolism investigation in cardiac, kidneys or brain applications.

## 4/ Work package "TRACERS AND CONTRAST AGENTS"

### ◆ IMMELAPT SPECT molecular Imaging and optimized aptamers for tumor detection

*Oncology*

Jean-Jacques Toulme, the Aquitaine Institute of Cognitive and Integrative Neurosciences (INCIA, UMR5287), 2012

TRAIL funding: 250 000 €

The ImMelApt project takes advantage of the potential of aptamers for recognizing a target of interest and aims at bringing an innovative answer to the need for imaging tumors in vivo. Starting from an aptamer we previously raised against the human MMP-9 - a protein that is overexpressed in tumors and is capable of degrading extra cellular matrix components, thus permitting cancer cell migration - we will i) synthesize and characterize several derivatives of this aptamer, ii) convert them into imaging probes, with different modalities, iii) image human melanomas ex vivo and iv) undertake in vivo experiments in animal model. The perspective of this project is the design of tools for detecting and monitoring human tumors, using SPECT molecular imaging

### ◆ PRITOR NeuroPeptide Receptors Imaging for TumOR Targeting

*Oncology*

Elif Hindie, the Aquitaine Institute of Cognitive and Integrative Neurosciences (INCIA, UMR5287), 2013

TRAIL funding: 30 000 €

Receptors of some regulatory peptides can be highly expressed in various human tumors, thus offering the opportunity of a specific molecular imaging with radiolabeled peptides. Advantageous pharmacological and pharmacokinetic properties as well as easy radiolabeling procedures make peptides attractive molecular tools for molecular imaging over

antibodies and their derivatives. The success encountered with the use of radiolabeled somatostatin analogs for imaging and targeted therapy of endocrine tumors that express somatostatin receptors is probably the first of a long list since multiple receptors are now recognized as potential targets.

This project will first compare the density and distribution of several neuropeptide receptors in human breast cancer in order to identify which one could be considered as the molecular target of highest interest.

The second part of the present molecular imaging project will consist in the pre-clinical evaluation of a [68Ga]-radiolabeled neuropeptide analog. Some analogs have already been synthesized by our teams

### ◆ SUPSIFLU Supported Silyl Fluorination

*Oncology*

Philippe Hermange, the Institute of Molecular Sciences (ISM, UMR5255), 2013

TRAIL funding: 30 000 €

Positron Emission Tomography (PET) has become a powerful tool for medical diagnostic over the last decade, as illustrated by the extensive use of 2-deoxy-2-[18F]-fluoro-D-glucose for tumor imaging. However, fast and efficient last-step labeling by short-lived radionuclides still remains a challenging task with biomolecule based tracers. Indeed, they require smooth reaction conditions and optimized purification steps to obtain high radiochemical yield and purity. Developing new methodologies to overcome these issues, our team has been successfully able to label peptides and oligonucleotides for in vivo trials using nucleophilic fluorination of a silicon-based building block. As part of the TRAIL work package 4, our efforts are now focused on making this methodology adaptable to a simple automatized process. For example, pre-packed cartridges of the desired tracer would definitively allow a wider use of this labeling strategy for pre-clinical

research by avoiding chromatography in purification steps. In this context, solid-phase supported tracers with a selective fluoride-triggered release could be perfect candidates. Despite these attracting advantages, no results on such tracers were reported to date, probably due to a lower reactivity of the very bulky di-tert-butylphenyl-silyl when is linked to a solid support. To overcome this effect, this emerging project proposes a positively charged leaving group (i.e. an imidazolium) that will facilitate the fluoride approach by salt metathesis. This moiety will be associated to the solid support and will ensure the selective release of fluorinated molecules (Scheme). Preliminary studies with a non-supported model compound have validated the concept in term of synthetic feasibility and reactivity towards fluoride. Thus, further experiments are needed to optimize conditions in the case of a real biomolecule and to develop the promising supported version for 18F fluorination

### ◆ PIAF PET Imaging of Angiogenesis by 18F-RGD

*Oncology*

Eric Fouquet, the Institute of Molecular Sciences (ISM, UMR5255), 2011

TRAIL funding: 164 000€

The project will firstly establish the interest of the  $\alpha v \beta 3$  integrin imaging by PET imaging, by conceiving and achieving the synthesis of an original 18F-RGD radiotracer, then experimenting it on a murine tumoral model of melanoma. Secondly, in a perspective of « proof of concept », our molecular imaging project will consist in the validation of the 18F-RGD as a marker of the biological effect induced by therapies, inhibiting neoangiogenesis such as Dendrogenin A (a new and promising anti-tumoral recently discovered). A further objective will be to complete the pre-clinical evaluation of the molecule to bring it up to the clinical state and assess in situ its impact on the tumoral neovascularisation in order to select

## 5/ Work package "BIOLOGICAL BIOIMAGING MARKERS"

### ◆ IBIONI

#### Imaging Biomarkers of experimental and clinical neuroinflammation

##### Neurology

Bruno Brochet, the "Physiopathology of neuronal plasticity" Inserm unit (Magendie Institute, U862), 2012

TRAIL funding: 251 036 €

This translational scientific project associates different neuroimaging, neuroepidemiological and neuroscience teams to study mechanisms and consequences of neuroinflammation using new imaging biomarkers in experimental models and human diseases, such as multiple sclerosis (MS). We will study (1) lateral diffusion along the astrocyte membrane of AQP4 in live cells using quantum dot imaging; (2) Validation of new biomarkers for tissue integrity characterisation in experimental models of MS using new high-sensitivity Diffusion Tensor Imaging (DTI), MR Diffusion kurtosis Imaging (DKI) and Diffusion Spectrum Imaging (DSI); (3) application of DTI, fMRI and Voxel based morphometry (VBM) to study the mechanisms of cognitive impairment in MS; (4) application of MRI markers in large cohorts of MS patients (OFSEP) and controls (I-Share).

### ◆ INNES

#### Investigation on Neuronal Energetic Substrate

##### Neurology

Anne-Karine Bouzier-Sore, the Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536), 2011

TRAIL funding: 149 971 €

Glucose is considered as the main brain energy substrate. However, increasing evidence now suggest that lactate, coming from astrocytes, could be a supplementary and very efficiency energetic fuel for neurons, especially during brain activation as well as during hypoxia. The aim of this project will be to characterize the role of lactate as a substrate for neurons during brain activation. Both ex vivo and in vivo situations will be studied. Originality of the ex vivo experiments is to directly analyze metabolism on brain biopsies using Nuclear Magnetic Resonance (NMR) at High Resolution at the Magic Angle Spinning (HR-MAS) spectroscopy after perfusion of <sup>13</sup>C-labeled substrates in awake rats. Resting as well as activated conditions (unilateral stimulation of the whisker-to-barrel pathway) will be compared. To model brain metabolism, <sup>13</sup>C-labeled glucose and lactate will be infused to animals during 1h, to reach the isotopic steady state. To determine whether MCT2 (neuronal monocarboxylate transporter) is involved in the transfer of astrocytic lactate to neurons, the same experimental procedure will be performed in rats in which MCT2 will be silenced using lentiviral approach. In vivo experiments will be also designed to follow in real-time brain lactate by localized NMR spectroscopy and molecular imaging of lactate at 7T also during whisker stimulation. Finally, we will investigate the implication of such a lactate shuttle between astrocytes and neurons and will perform experiments on neonate model of brain hypoxia to study whether lactate administration directly after hypoxia could be neuroprotective and therefore used as a therapeutic tool.

### ◆ SCICOG&REACTIV

#### Bio-imaging markers of tissue integrity, predictors of cognitive impairment in inflammatory demyelinating diseases

##### Neurology

Bruno Brochet, the "Physiopathology of neuronal plasticity" Inserm unit (Magendie Institute, U862), 2011

TRAIL funding: 130 000 €

Multiple Sclerosis (MS) is the main non-traumatic cause of neurological disability in young adults. There is growing evidence that the clinical disability in MS is not only due to motor deficiencies but also to cognitive deficiencies. Cognitive deficiencies could occur at the early stages of MS (high-risk clinically isolated syndromes (CIS) and early MS) and concern mainly information processing speed (IPS) and memory. Recent works suggested that cognitive deficiencies correlate with MRI parameters reflecting diffuse alteration in brain white matter leading to disconnection between cortical areas but also with atrophy of the brain gray matter. The aim of this project is to determine which MRI parameters could be use as a biomarker to predict cognitive deficiencies in CIS and which MRI parameters could predict the responsiveness of MS patients to cognitive rehabilitation. Two parameters will be studied, fractional anisotropy in brain normal-appearing white matter using diffusion-tensor-imaging and volumetric change in brain gray matter using Voxel-Based Morphometry. This project is based on two clinical studies, the SCI-COG, a one-year longitudinal study of CIS patients starting early 2012 and the REACTIV study, an on-going controlled trial of cognitive rehabilitation in MS. This is a 36 months project. Both studies received funding from industrial partners and ARSEP but this application concerns the need for additional human resource (study engineer) to complete image analysis

## ◆ TRANSFEAR Translational study of the cerebral substrates involved in pathological fear recovery

*Neurology*

Melissa Bonnet, the  
"Physiopathology of neuronal  
plasticity" Inserm unit (Magendie  
Institute, U862), 2012

TRAIL funding: 130 000 €

Anxiety Disorders including post-traumatic stress disorders (PTSD) are the most common mental disorders with an estimated lifetime prevalence of 15% -20% in the general population. They occur early in life and are risk factors for other mental disorders later in life such as affective disorders and substance abuse disorders thus presenting a major health problem in industrialized countries (WHO and WONCA 2008). In recent years, it has become evident that associative learning mechanisms and alteration in sleep architecture play a crucial role in relapse of fear behaviors. Indeed, it is known that exposure to stimuli that have been repeatedly associated with traumatic events can precipitate fear behavior during relapse and that the lack of extinction consolidation during post-extinction sleep correlates with high fear recovery. While tremendous progress has been made in identifying the basic mechanisms underlying acquisition of fear and consolidation of extinction, much less is known about the neuronal mechanisms involved in fear relapse after extinction. The present translational proposal aims at identifying the changes in functional connectivity of cerebral structures involved in relapse of fear behavior using innovative technologies in both animal and humans. Firstly, we will develop and validate a fear conditioning and extinction protocol in healthy humans, which shares similarities with that currently used in rodents, in order to provide a strong physiological background on fear extinction mechanisms in healthy context. Secondly, we will study the changes

in functional interactions between neuronal structures involved in fear and extinction learning during fear behavior using electrophysiological recordings in rodents and functional Magnetic Resonance Imaging (fMRI) technique in humans. Finally we will assess sleep modifications in rodents and healthy humans by using neuronal recordings and electroencephalography (EEG), respectively. The proposed studies will reveal how the functional organization of specific neural structures directly modulates relapse of fear behavior using relevant animal and human models. Elucidating the neural mechanisms mediating pathological fear recovery should further suggest novel therapeutic strategies for psychiatric conditions characterized by a high propensity to relapse such as PTSD.

## ◆ BIOPSYPROSTAPROBE Antibody-based fluorescence probe for biopsy guidance of prostate cancer

*Oncology*

Franck Couillaud, the Centre of  
Magnetic Resonance of Biological  
Systems (RMSB, UMR5536), 2014

TRAIL funding: 35 000 €

Prostatic carcinoma is the most common cancer affecting one in six and is a leading cause of cancer mortality. Cancer detection include imaging and tumor biomarker dosage like PSA (prostate-specific antigen), but actually all of examinations cannot diagnose prostate cancer at an early stage with sufficient confidence. Therefore a tumor biopsy is required to confirm the presence of the tumor, its size and its grade. Because these biopsies are negative in around 60% of cases, new methods for biopsy guidance are required. As member of the The BiTum consortium, we have proposed to combine fluorescence imaging to the ultrasound imaging currently used in clinic, in order to detect small prostate tumors making possible to guide the transrectal

biopsy. The goal of the current project is to develop a fluorescent probe based on a labeled antibody. We have selected a ScFv fragment of the monoclonal D2B anti-PSMA antibody, provided by our Italian collaborators to be labeled with a near infrared fluorophore. This fragment is known to specifically targeted in vivo subcutaneous tumor in mice. The test probe efficiency in physiopathological context as close as possible of clinical conditions, we are proposing to develop a prostate cancer model using mouse RM1 cells in immunocompetent mice. RM1 cells will be genetically modified to express both human PSMA and imaging reporter genes in order to test labeling specificity. Completion of the current project will open avenue for translational application of ScFv fragment for biopsy guidance of prostate cancer. That's why this innovative way of the project has appeared in directly coupling the scFvD2B fragment to a near infrared fluorophore

## ◆ MIMATHUMAB Molecular IMaging of ATHeroma with HUMAn AntiBody

*Cardiology*

Gisèle Clofent-Sanchez, the  
Centre of Magnetic Resonance  
of Biological Systems (RMSB,  
UMR5536), 2012

TRAIL funding: 195 000 €

MIMATHUMAB project focuses on molecular imaging of atherosclerosis, using human antibody discovery for high quality functionalization of nanoparticles dedicated to safe and non-invasive magnetic resonance imaging (MRI) and for radiolabeling with 18F for positron emission tomography (PET). This translational project at the crossroads of WP5 and cardiology domain is part of a wider interdisciplinary research aimed at developing a theranostic approach for atherosclerosis. Atherosclerotic lesions (atheroma), the leading cause of the majority of cardiovascular

disorders, are asymmetric focal thickenings of the innermost layer of the artery, the intima. They consist of cells, connective-tissue elements, lipids and debris. Atherosclerosis is a disease involving endothelial dysfunction, oxidative stress, immunity, inflammation and calcification. The inflammatory lesions evolve to vulnerable plaques at high risk of rupture and thrombi formation, thus precipitating the clinical conditions of stroke and myocardial infarction, the main causes of death in the Western world. The goals for the years to come must include translation of the experimental work to the visualization of appealing biologic targets in humans. Nowadays, there is an increasing interest in molecular imaging of atherosclerosis, in order to assess the cellular components that underlie the risk of rupture. Molecular imaging requires highly sensitive and specific probes made of a signal detection compound and an affinity ligand for targeting. In this project, we aimed to achieve molecular imaging by functionalizing imaging devices with recombinant human single chain Fv (scFv) antibodies (Abs) designed to target vulnerable plaques developed in atherosclerosis. MIMATHUMAB differs from international competition as it offers human antibodies (Abs) targeting relevant biomarkers to functionalize multimodal

nanoparticles. Our team has the know-how for in vivo selection of human Abs in animal models of atherosclerosis. This emerging project is initiated with an international team also deeply involved in atherosclerosis and antibody research for use in human beings. In order to implement a new strategy to diagnose atherosclerosis by MRI, we also need strong contrast agents. We therefore come closer to UPR9048 CNRS (Institut de Chimie de la Matière Condensée de Bordeaux, groupe 5 « Chimie des nanomatériaux ») which has recently developed a platform of superparamagnetic nanoparticles, the VUSPIO (Versatile Ultrasmall SuperParamagnetic Iron Oxide) platform that can accommodate targeting ligands such as chimeric or fusion proteins, peptides or antibodies. The project offers the unique opportunity to develop recombinant strategies and agents starting from the initial design up to the final in vivo evaluation. Owing to its multidisciplinary competences, this project takes on special importance within TRAIL, which leans by definition on translational and multidisciplinary approaches.

## 6/ Work package "MATHEMATIC SIMULATION AND MODELING"

### ◆ MOD: Mathematical modeling of the response to antiangiogenic drugs via medical imaging

*Oncology*

Thierry Colin, the Bordeaux  
Institute of Mathematics (IMB,  
UMR5251), 2013

TRAIL funding: 180 000 €

The aim of this project is to propose mathematical models for evaluating the response to anti-angiogenic drugs using functional imaging. The ultimate goal of this approach will be to be able to propose numerical tools in order to predict the evolution of the growth of a tumor or its long-term response to a treatment using the early response, measured through functional imaging.

The methodology will be the following one: we start by writing a mathematical model (using a set of partial differential equations) that relies on a mechanistical description of the tumor growth. Usually, this model will involve a set of "free" parameters (less than 10) that are unknown and to be determined. Then we check that this model is able to describe, at least qualitatively, the behaviors that are observed on longitudinal series of CT-scans or MRI. At this point two strategies are available: 1/ The first one consists in trying to describe the characteristics of the image (as for example the texture of the image of the tumor) through the model in order to explain the effect of the drugs. For example, it is well known that the effect of anti-angiogenic drugs may not only be observed on the change of shape of the tumor but also on its constitution. Using series of longitudinal data, we will try to highlight new numerical markers evaluating the long-term response to the therapy. 2/ The second approach will be to provide patient-specific prognosis: we try to find the «best» values of the parameters that allow to match with the series of imaged by solving an optimization problem; then we make a prediction using this set of parameters. This strategy has been successfully used

for evaluating the aggressiveness of lung metastases without treatment in the team MC2 of T. Colin. We will develop this methodology in two directions. The first axis is devoted to NSCLC and brain metastasis and the second one to kidney cancers and lung metastasis. We will develop below the specificity in terms of imaging of both axes.

#### **Axis 1: Modeling the response of NSCLC to Avastin**

We plan to use diffusion MRIs in order to parametrize the model as well as the new sequences developed in the team of S. Miraux. This study will rely on a clinical trial in Bergonié (J. Palussière). Experiences on the small animal will be provided by the team of A. Bikfalvi. The modeling part will be done in the team of T. Colin.

The RMSB team led by S. Miraux has the expertise in 3D small animal MR imaging for the detection of small brain metastases in vivo, without requiring the use of any contrast agent. These methods allow for longitudinal studies and tumor volume quantifications in order to get the information necessary to develop a predicting model of tumor growth. However, imaging lungs, in small animals as well as in humans, remains a challenge in MRI due to its really low SNR, respiratory motion and susceptibility artifacts generated by the air-tissue interface.

For this purpose, novel radial MR sequences (Gradient echo or trueFISP) will be performed and optimized in order to obtain high contrast between metastases and healthy lungs without any artifacts on the MR images.

This optimization will be performed on a 7T pre-clinical scanner for small animal (RMSB) and in parallel on a 1.5T clinical scanner at Bergonié Institute (in collaboration with Siemens).

For the pre-clinical study, a well-known model of brain metastasis using human breast cancer cells will be used to validate the optimization of the MR sequences. These data will have to be accurate enough for computer scientists to establish a mathematical model predicting the

metastases growth in the mouse brain.

In a second step, to get closer to the clinical practice, renal tumor cells will be orthotopically injected into mice inducing pulmonary metastasis (INSERM U 1029). The MR sequence optimization followed by the mathematical model will be tested and compared with brain metastases.

For clinical studies, patients developing pulmonary metastasis will be selected and longitudinally imaged using the optimized sequences (Bergonié).

#### **Axis 2: Modeling the response of renal cell carcinomas (RCC) to anti-angiogenic drugs**

The strategy will be similar to axis one and concerns RCC with or without metastases to other organs (pancreas, lung). Based on the key step of hypoxia, which promotes cancer development, we will integrate parameters obtained from several imaging techniques in order to improve the accuracy of the model.

The first step will be to obtain test data from specific MR sequences, such as Dynamic Contrast Enhanced or BOLD sequences, provided by the 3T clinical MRI of Pellegrin Hospital (F. Cornelis, N. Grenier) with the technical support of General Electrics (B. Perez). All these imaging techniques are currently developed and added to the morphologic MR evaluation performed during clinical studies on RCC directed by A. Ravaud (St André Hospital).

New algorithms of real time adaptive distortion correction (B De Senneville) will be progressively integrated in these MR acquisitions. The second step will be to integrate data obtained from specific radioactive markers for TEP scan (P. Fernandez, H. de Clermont) focus on hypoxia such as F miso.

## ◆ CRYOIMMUNO Cryo immunotherapy of metastatic renal carcinoma

*Oncology*

François Cornelis, the Bordeaux  
Institute of Mathematics (IMB,  
UMR5251), 2014

TRAIL funding: 35 000 €

An improved understanding of renal cell carcinoma (RCC) tumour biology has resulted in major advances in the treatment of patients with metastatic RCC (mRCC). Novel strategies that combine a cytoreductive modality (i.e. intra-tumoral destruction, by percutaneous image-guided cryoablation in our case) with immune-modulation, obtained by the adjunction of more and less specific drugs, are promising strategies for the management of tumors. Such approach is currently a wide field of development in oncology and immunology; and has promising preclinical results. However, at this time, no clinical study has been conducted in order to evaluate the real impact of the combination of cryoablation and immune-modulation. By implementing these recent preclinical findings, we hypothesize that this strategy will confer long-term immunity, and ultimately cure, by exploiting the biology of the tumor and the immune system of the effected individual. We would like to propose clinically this hypothesis in patients who already benefited in routine practice of a cryoablation and required the development of novel therapeutic strategies in order to improve the standard of care and life expectancy. To adequately validate this hypothesis, our study requires to develop a reliable methodology of evaluation. Imaging and immunologic explorations will assess the therapeutic response and may improve the understanding of the mechanisms involved.

Development of such explorations and corresponding biomarkers should also improve the knowledge, provide in the future a better therapeutic evaluation in routine practice and help to widely spread the techniques in primary or secondary care centers.

## ◆ NEKOMRI MRI sequence for bronchial wall segmentation and analysis

*Pneumology*

Fabien BALDACCI, the Bordeaux  
Cardio-Thoracic Research Centre  
(CRCTB, U1045), 2014

TRAIL funding: 35 000 €

The aim of this project is to develop bronchial wall segmentation and analysis methods on a new MRI sequence for lung acquisition, allowing both a diagnosis by using a MRI instead of CT scan, and the assessment of bronchial remodeling.

## 7/ Work package "COHORT IMAGING METHODOLOGY"

### ◆ ABACI

#### Automated Brain Anatomy for Cohort Imaging

Neurology

Bernard Mazoyer, the Neurofunctional Imaging Group (GIN, UMR5296), 2012

TRAIL funding: 415 000 €

The ABACI project (Automated Brain Anatomy for Cohort Imaging) consists in developing, testing and applying a software toolbox dedicated to the automated processing of structural MRI, acquired in the framework of cohort studies. The project closely fits with the TRAIL laboratory of excellence strategic plan that includes population neuroimaging as one of its key topic. The project federates three neuroimaging teams of TRAIL with two non-TRAIL teams specialized in neuroepidemiology. Unsupervised pipelines for registration, normalization, segmentation and morphometric analysis of structural brain MRI acquired in large longitudinal cohorts will be implemented. These pipelines will deliver global and regional brain anatomy phenotypes for grey matter, white matter and CSF. Whenever possible, widely used and validated public domain neuroimage processing algorithms will be integrated. The project will be linked to and run in parallel with i-Share, a large size MRI cohort of students that will serve as a test cohort for the toolbox. In addition, all participating teams will have the opportunity to test and adapt the tools to their own cohorts and settings, with opening applications in the fields of multiple sclerosis, stroke and brain aging. Commercial use of the toolbox by non academic users will be proposed.

### ◆ TRAIL&TRACKS

#### Atlasing whole brain white matter tracts in 300 healthy humans

Neurology

Laurent Petit, the Neurofunctional Imaging Group (GIN, UMR5296), 2011

TRAIL funding: 97 500 €

The present project proposes, using diffusion tensor imaging (DTI) tractography, to create a normative population-based probabilistic atlas of white matter tracts in healthy humans (TRAIL&TRACKS) for research, clinical and educational purposes. It is based on the BIL&GIN cohort, which includes 300 healthy volunteers aged between 18 and 50 years, balanced between men and women, right-handers and left-handers. The doctoral fellowship application deals with the work to be performed on DTI data, the validation of a method for probabilistic tractography of a set of white matter tracts, the anatomical description of every tracts and how they differ among the 300 subjects in terms of hemispheric asymmetries, gender and handedness. Specific metrics of white matter integrity will be extracted for tracts in the brainstem and projection, association, and commissural tracts. This is not to propose another atlas of the white matter of the human brain, but a tool where inter-hemispheric asymmetry and inter-individual variability will be taken into account into the description of each tract. Once patented, we will deliver an automated tract-labeling tool interfaced with usual neuroimaging analysis software. Several publications are envisaged for the construction of this atlas, including the edition of a textbook and numerical tools such as web-based application for teaching material and training.

### ◆ COBRASCAN

#### Quantitative CT and COBRA cohort for study of chronic obstructive pulmonary disease

Pneumology

François Laurent, the Bordeaux Cardio-Thoracic Research Centre (CRCTB, U1045), 2013

TRAIL funding: 134 448 €

Chronic obstructive pulmonary disease (COPD) is expected to be the 3rd leading cause of mortality and the 5th cause of morbidity in the world by 2020. The pulmonary component of COPD is characterized by airflow limitation that is not fully reversible. Airflow limitation is defined by pulmonary function tests (PFT) results and is caused by narrowing of small airways which is a consequence of the combination of airways wall thickening due to airway wall remodeling and loss of tethering force due to emphysematous lung destruction. However patients with the same airflow limitation will present with different clinical subtypes, in term of severity and outcome. The effect of certain treatments can be only proved in term of primary outcomes if there is a mean other than pulmonary function tests for classifying patients into phenotypes in longitudinal studies. The prognostic impact of these phenotypes is still poorly known.

Advance in CT technology and CT image analysis programs, i.e. CT algorithms herein referred to as quantitative CT (QCT) can be used to analyse in details the morphological changes involved in COPD, i.e. the severity of emphysema, airways dimensions, small airways obstruction and small pulmonary vessels on CT images. Our group has developed software needed for combined quantitative analysis of structural changes of proximal and distal airways and can use software dedicated to quantification of emphysema and pulmonary vessels. However, there is still no consensus in term of the best appropriate

algorithms for quantification.

The COBRA project directed by INSERM relies on a national cohort of 500 patients. The main objective of the COBRA cohort is to determine clinical, biological and genetical determinants of the outcome of COPD patients. The recruitment started in 2008 and inclusion of 500 patients is finally expected, 211 of them being included so far. Clinical, functional and biological variables will be followed up over 10 years. COBRASCAN will consist in a QCT acquisition performed in each patient included into the COBRA cohort during the 5th year

after inclusion. The hypothesis is that a CT quantitative morphological analysis reflecting lung parenchymal destruction (emphysema), bronchial wall remodeling of large and small airways and changes in pulmonary vessels has a significant prognostic impact. The originality of COBRASCAN will be its ability to identify phenotypes of COPD patients based on multiple morphological criteria and to specify their prognostic value. The innovative aspect of the project is the development of a single new software able to combine the acquisition of objective data of emphysema, bronchial wall thickening of proximal

and distal airways, large vessels size, reflecting changes of the whole respiratory system. The software will be built based on the most robust and reproducible algorithms available and the most relevant variables for each type of morphological changes will be determined. The study will specify the role of quantitative CT as a biomarker of COPD, and its position in on-going clinical trials. Phenotyping COPD into appropriate subgroups using imaging in addition to PFT is likely to play a role in pharmacological research.

# WP1: MRI guided HIFU

## Research objective of WP1

WP 1 aims to develop preclinical and clinical research activities in the field of image guided therapeutic procedures. The main focus was given to the combination of High Intensity Focused Ultrasound (non-invasive treatment) and MRI (targeting, real-time monitoring of the procedure and follow-up). Following a translational approach, such methods should be developed for studies on small and large animals, and be applicable to the treatment of clinical diseases in oncology and cardiology. Due to the important modifications of the local research teams at the beginning of the TRAIL funding (the core laboratory headed by Dr C Moonen was closed mid 2011), a strong effort has been made over the last 3 years to progressively reorganize this activity.

- › IHU LIRYC grant for the acquisition acquiring a 256 elements MR-compatible HIFU device designed for large animal studies
- › France Life Imaging grant for 1) the design and acquisition (co-financial support of the Aquitaine council) of a benchtop HIFU setup for rodents (under effective operation since january 2014), 2) a Clinical MR-HIFU platform for the treatment of breast tumours (system delivered end November 2014, 3) a preclinical MR-compatible HIFU device dedicated to rodent (to be operated in high field MRI Bruker scanner) to be acquired first quarter 2015.

## Current scientific activities and results

### Cardiology

This task is part of the IHU LIRYC research project. The objective is to develop non-invasive treatment of cardiac arrhythmia using thermal ablation and contactless stimulation. The research team showed the proof of concept of both thermal ablation and contactless cardiac stimulation on an ex vivo model of beating pig heart (Vaillant et al, ISMRM 2014). Stimulation was performed using non-destructive HIFU burst pulses (millisecond range) that are delivered

synchronously with the cardiac cycle to induce premature atrial/ventricular contraction (Marquet et al, ultrasound IEEE symposium 2014).

Schematic (a) of the setup. The ex vivo heart is continuously beating and positioned on top of a 256 elements HIFU platform. Two MR-compatible catheters are inserted into the left atrium and ventricle to collect contact electrophysiology (EP) signals in both cavities. MR image allowing precise 3D selection of the HIFU spot location in the ventricle. EP signals (c) recording over 3 heart beats showing successive depolarisations of the atrium (top trace) followed by the ventricle (middle trace). The first 2 beats are in sinus rhythm and a premature ventricular contraction can be observed when an HIFU pulse of 5 msec is generated (bottom trace) after the refractory period of the ventricle. Photograph of heart showing a thermal lesion induced in the ventricle with a 10 sec HIFU sonication at 120 W acoustic power. The lesion is approximately 3x10 mm in dimensions and is located into the myocardium. Such a lesion is difficult to achieve with conventional catheter-based ablation, where the active part of the catheter is in contact with either the endocardium or epicardium.

For this research project, dedicated MR instrumentation

## Project building

Dr B Quesson, CNRS researcher at Inserm U1045 and head of the imaging team of the IHU LIRYC Institute was in charge of this task. Image Guided Therapy SA (local company developing MR-compatible HIFU technology) was identified as the industrial partner for HIFU devices. This project required important investment in dedicated equipment and received the financial support from:

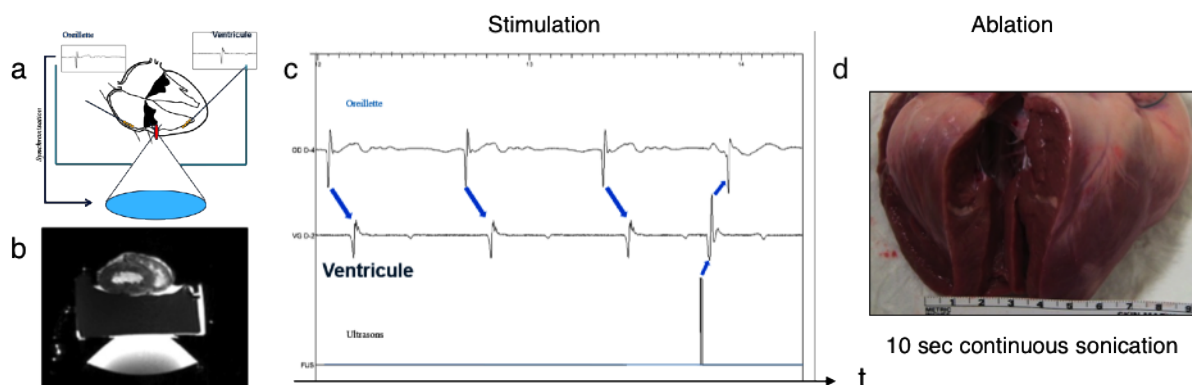

Figure 1: contactless cardiac stimulation (a-c) and ablation (d) with MR-guided HIFU on a pig heart.

(electrophysiology catheters, filters...), HIFU methods (burst pulses synchronized on the electrophysiological signals, trans-costal HIFU sonication, enhanced sonication efficacy by non-linear ultrasound effects such as cavitation and boiling), Real-time MRI (sub-second acquisition and reconstruction methods, real-time data transfer, real-time motion correction and processing) for monitoring temperature (MR-thermometry) and displacement (MR-ARFI) induced by ultrasound are currently developed (abstracts submitted to ISMRM 2015 conference). This application is probably one of the most challenging due to motion of the organ (cardiac contraction and respiration), presence of ribs in the HIFU beam path and important cooling effect due to blood flow into the cardiac cavities. The research team (2 post-docs, 2 docs, 2 engineers, 1 technician, all part of the IHU imaging team) is working on addressing these major technical challenges and each improvement will directly benefit to other applications (e.g. breast, liver...) in order to offer a better control of the procedure for patient safety and increased treatment efficacy. The IHU is equipped with a 1.5 T Siemens Avanto and a Bruker 9.4T/30 cm, both full time dedicated to preclinical research and technical developments. Real-time cardiac thermometry/MR-ARFI is currently being developed in this team. The imaging methods and associated processing are directly transferable to other organs.

### **Small animal studies**

The HIFU benchtop is currently used in projects (Dr Franck Couillaud) on transgenic mice bearing tumours expressing thermo-inducible optical imaging reporter proteins for bioluminescence and fluorescence. This work tries to establish in vivo proof of concept for innovative thermo-therapies targeting tumours microenvironment (macrophages and angiogenesis).

Several teams working at University of Bordeaux have shown interest in having access to the MR-HIFU technology adapted to small animal for different applications (brain, heart, liver, study of pain processes,

tissue regeneration...) and strategies (ablation, control of gene activation, stimulation, drug delivery). Most of these teams will benefit from the new MR-HIFU platform dedicated to small animal (installation planned first half 2015). The financial support of TRAIL in human resources will help setting up this open platform over the next two years. One of the objectives is to develop and easy-to-use MR-HIFU platform in order to help the development of collaborative projects between the local teams and to attract other research teams for future applications. For this purpose, it appeared necessary to integrate this HIFU platform into a high field magnet in order to provide higher spatial resolution of the MR images. Dedicated acquisition sequences will be developed and associated image processing. Collaboration has been initiated with Dr Benoît Larrat (CEA Saclay) who has an established expertise in this domains, and share similar research interest and technological platform.

### **Transfer toward Clinical applications**

One MR-HIFU platform (Philips Sonalleve) is already installed at Hospital Saint-André (Pr H Trillaud,) for the treatment of Uterine Fibroids. A second platform dedicated to the non-invasive treatment of breast cancer has recently been acquired. This project associates IGT SA (Erik Dumont), IHU LIRYC (Bruno Quesson), Anti Cancer Center Bergonié (Pr Jean Palussière) and University of Utah (Pr Dennis Parker). After initial testing of the platform at IHU LIRYC, the breast system will be transferred to the anticancer centre with the objective of treating the first patients in first half of 2015.

### **Added value of TRAIL funding**

The main financial contribution of TRAIL for the development of these research projects is a 2 years post-doctoral position for the development of the small animal platform and the treatment of the breast tumours. Regarding the large number of research topics mentioned above, the financial support from TRAIL for

human resource is expected to be increased in the future to accelerate project development.

## WP2: new sequences, new contrasts

The goal of the WP2, is to develop innovative MR sequences and to applied these new methods in clinical domain, from oncology to neurosciences.

The effort has been focused on the development on 3D (and more) sequences to become more quantitative, to increase spatial and temporal resolutions, increase sensitivity and specificity of MRI.

Project are generally divided on three main and interconnected steps: sequences design and implantation, preclinical evaluation (on small animals) and transfer to clinical research and applications.

Since TRAIL starting in 2011, two project have been funded in the WP2 :

- › HR-DTI (2013-2016), PI : B Hiba, 130 k€. The goal of this project is to develop robust Diffusion MR sequences and reconstruction algorithm and applied them for high resolution diffusion tensor imaging of the brain.
- › NewFISP (2013-2018), PI : S. Miraux, 250 k€. The goal of this project is to develop new 3D sequences based on gradient echo acquisition and applied them for cardiovascular imaging and oncology imaging.

### Originality

To generate 3D time-resolved images (for cardiac imaging) or images with high spatial resolutions (for diffusion imaging) it is necessary to acquire MR information as quickly as possible. This limits motion artifacts and too long examination time.

To do this, in the NewFISP project, method of non-Cartesian k-space encoding scheme was developed. This method, with a double golden angle strategies (double random), allows to generate 3D cine angiography, in small animals, with a acceleration factor of 5 compared to the conventional cartesian method (Trotier al. MRM 2014).

In the HR-DTI project, robust reconstruction algorithms were implemented to rebuild diffusion images with very high spatial resolution based classical 3D diffusion imaging sequences with short acquisition time (Coupé et al. NeuroImage 2013).

### Orientations

The next steps of the WP2 will focus on the development of non-cartesian, or hybrid radial-cartesian 3D k-space encoding scheme and coupled these new methods with powerful

reconstruction strategies like Parallel Imaging or Compressed sensing.

The transfer of already published methods from preclinical to clinical research will also be a major part of the WP2.

### Strength

Based on new radial sequences developed during the first part of the NewFISP project, other sequences have been developed in 2 others projects funded by national french agency ANR (ultra-short TE sequences for tissue engineering evaluation, and whole body MR sequences for tumor molecular imaging).

The NewFISP project has been reinforced by a second PhD student.

The post-doctoral researcher recruited in the NewFISP project (Emeline Ribot) has obtained a permanent position at the CNRS (competition with 4 positions per year for approximately 150 applicants).

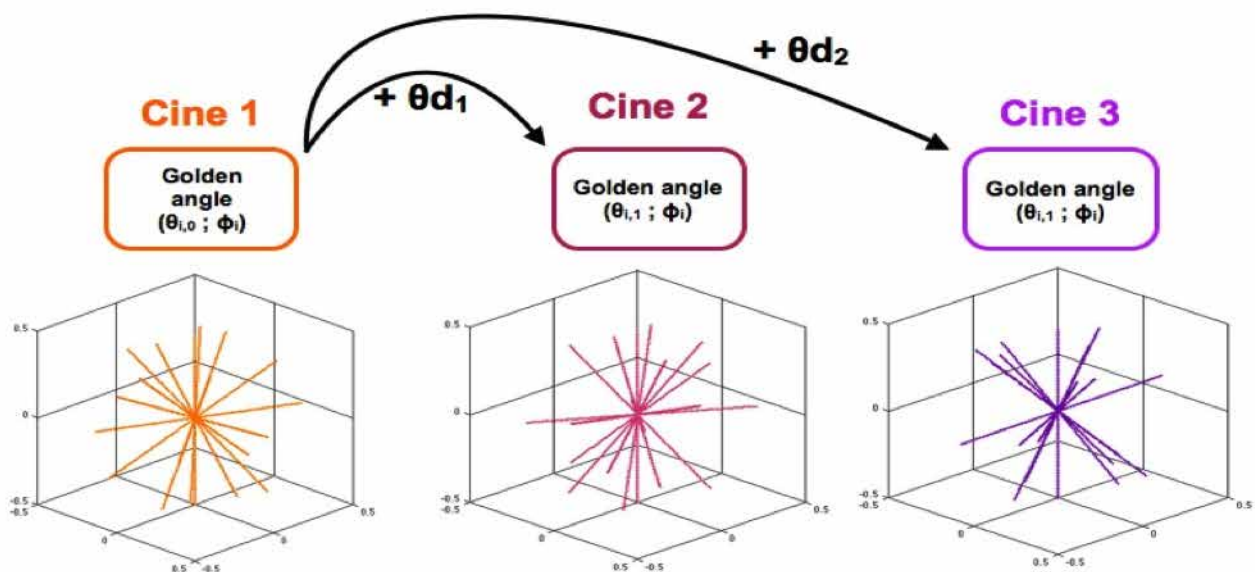

Fig : 3D double golden angle encoding scheme for cine MR angiography.

## WP3: dynamic nuclear polarization

The work package « Dynamic Nuclear Polarization » is divided in two separate approaches: in situ DNP and dissolution DNP.

### a) In situ DNP

In situ DNP can be done in vivo in mice at 0.2T as seen from Overhauser-enhanced MRI of stable nitroxides. Proteolytic activity was recently spotted in vivo using a home-made design of an Overhauser switch. Work is in progress to design modified nitroxides to assess specifically abnormal proteolysis (inflammation, cancer). Translation to the clinical practice shall strongly depend upon the possibility of funding new class of MRI instruments at low-fields. In situ DNP publications (work funded by TRAIL):

- › Alkoxyamines: toward a new family of theranostic agents against cancer. Moncelet D, Voisin P, Koonjoo N, Bouchaud V, Massot P, Parzy E, Audran G, Franconi JM, Thiaudière E, Marque SR, Brémond P, Mellet P. *Mol Pharm.* 2014 Jul 7;11(7):2412-9.
- › In vivo Overhauser-enhanced MRI of proteolytic activity. Koonjoo N, Parzy E, Massot P, Lepetit-Coiffé M, Marque SR, Franconi JM, Thiaudière E, Mellet P. *Contrast Media Mol Imaging.* 2014 Sep;9(5):363-71.
- › Overhauser-enhanced MRI of elastase activity from in vitro human neutrophil degranulation. Parzy E, Bouchaud V, Massot P, Voisin P, Koonjoo N, Moncelet D, Franconi JM, Thiaudière E, Mellet P. *PLoS One.* 2013;8(2):e57946

New classes of nitroxides are being developed in collaboration with the UMR 7273, Marseille (Institute for Radical Chemistry). These molecules can display various EPR signature as a function of their ionization state. Such molecules shall be evaluated in vitro as of their ability to provide an Overhauser switch. The selected probes are aimed to be coupled to peptide substrates and evaluated in the frame of proteolysis detection.

Of note, year 2015 shall be a crossroads : the research activity is at the total dependency of the renewal of the open-magnet low field MRI

system which should take place in 2015 in a new building: indeed, the current MRI site will be retired and reconverted, with no possibility of moving the old low-field MRI system.

### b) Dissolution DNP

Dr Silvia Rizzitelli has been recruited as a postdoctoral fellow in July 2014 (project Oncoflux funded in 2014). The polarization of metabolites such as pyruvate has been demonstrated and in vivo protocols are currently implemented in small animals. The main objectives remain the investigation of metabolic diseases (lung and brain cancer in the Oncoflux project) and the investigation of brain metabolism.

The application of hyperpolarized substrates will remain focused on the investigation of tumor cells and brain metabolism. In order to initiate a translational research program on the 3T whole-body MRI magnet to be installed in the IBIO building, it is reminded that these translational studies require multi-nuclei imaging configuration and capabilities for this research MRI scanner.

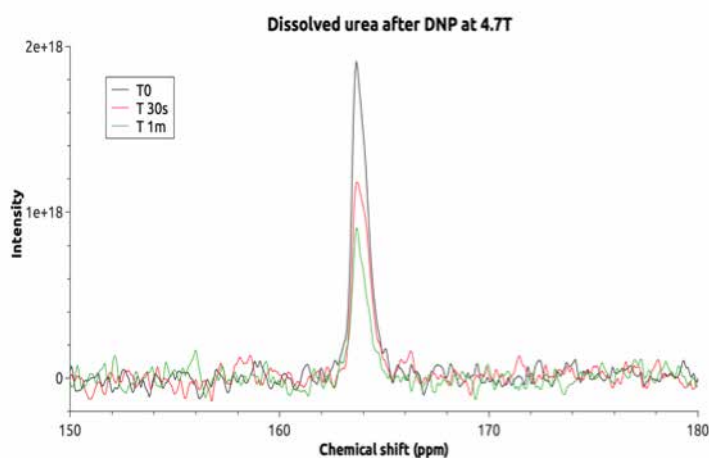

Figure : NMR and MRI of rat brain using micro-dialysis probe (left image). NMR acquisitions from hyperpolarized metabolites (right plot).

## WP4: tracers and contrast agents

The purpose of the Work Package 4 is to develop tools to synthesize molecules or modified biomolecules and to use them as imaging agents in the framework of projects whose translational character is more or less marked, particularly in the areas of oncology and neurology.

It is important to note that the chemistry developed upstream mainly concerns the molecular covalent and coordination chemistry. Other areas such as nanoparticles for instance are not covered by the Labex TRAIL. Nevertheless, this point could be the subject of inter Labex collaborative projects

The WP4 has actually founded four research projects (two federative and two emerging) for a total amount of 474k€ since the end of 2011.

PIAF (119 k€ in 2011 and 45k€ in 2014) concerns the development of a new silicon based F18 labelling

technic of peptides then applied to the PET Imaging of angiogenesis by 18F-RGD and finally used for the in vivo evaluation of a novel anti angiogenic agent (Dendrogenine A).

IMMELAPT (250 k€ in 2012) concerns the synthesis of innovative aptamers recognizing a human protein (MMP9) overexpressed in tumours, then their labelling for ex vivo and in vivo imaging.

SUPSIFLU (30 k€ in 2013) aims to develop a new 18F labelling strategy on solid support that may be applicable to a wide range of biological molecules.

PRITOR (30 k€ in 2013) concerns the imaging of neuropeptide receptors for tumour targeting.

Furthermore, the contribution of TRAIL Labex has also facilitated the internationalization of these projects by facilitating exchanges with partners (INMAS, New Delhi, India

and Aarhus University, Denmark). Currently 3 out of 4 projects are directed toward potential applications of imaging in oncology. Only SUPSIFLU which is a very early stage project could be in a second phase directly applied to other topics of interest for TRAIL such as neurology. It should be noted that none of the current projects concerns the multi modal imaging. In a reflection on the future evolution of WP4, it became obvious that this dimension should be integrated and promoted in future projects

## WP5: biological bio-imaging markers

Selected WP5 projects have covered Neurology, Oncology and Cardiology themes. The distribution was made as follows: four projects in Neurology funded up to 661,000 €, one project in Oncology funded up to 35,000 € and one project in Cardiology funded up to 195,000 €.

Each project fosters the development of translational research from the targeting of a physiological process, a cell or a molecule involved in pathologies to the implementation of the focused bio-imaging in humans. WP5 funding in LabEx TRAIL gave rise to publications and grants. More importantly, the support of LabEx TRAIL impacted on the future and allowed the leverage of additional funds and industrial partnerships.

### To define biomarkers of pathophysiological events

#### 1-Focusing on functional connectivity of cerebral structures involved in Anxiety Disorders including post-traumatic stress disorders (PTSD)

Transfear : Translational study of the cerebral substrates involved in pathological fear recovery 130,000€

Transfear proposal aims at identifying the changes in functional connectivity of cerebral structures involved in relapse of fear behavior (such as dysregulation of medial prefrontal cortex - basolateral amygdala functional interaction), using electrophysiological recordings in rodents and functional Magnetic Resonance Imaging (fMRI) technique in humans performed with a 3T MRI magnet. A 3T neuroimaging in healthy humans represents the best and the most precise available tool to deeply investigate the functional relationships within the cerebral networks of interest. Elucidating the neural mechanisms mediating pathological fear recovery should further suggest novel therapeutic strategies for anxiety disorders characterized by a high propensity to relapse such as PTSD.

Partners of Transfear are :

- › TRAIL team : UMS CNRS 3428, Plateforme de BioImagerie, Univ

Bordeaux (Dr. M. Bonnet, Research Unit of Pr. V. Dousset)

- › Non TRAIL teams : INSERM U862, Univ Bordeaux (Dr C. Herry) ; INSERM U862, Univ Bordeaux (Pr. B. Aouizerate); USR CNRS 3413, Univ Bordeaux (Pr. P. Philip)

Added value of TRAIL funding :

- › InterLabEx project (with BRAIN)

Current scientific activities and results:

- › In animals: Simultaneous recordings of several brain regions were carried out in a group of 7 animals.
- › In humans: Difficulties were encountered in the management of equipments due to the need of using electric currents (for stimulation) in an MRI environment. Agreements were obtained from the Regional Ethics Committee and the National Agency of Drug Safety (ANSM). Volunteer recruitment is under way.

#### 2-Focusing on brain gray and white matter in multiple sclerosis

SCI-COG & REACTIV : Imaging biomarkers of brain gray and white matter in multiple sclerosis cognitive impairment

130,000€

The aim of this project is to determine which MRI parameters could be used as a biomarker to predict cognitive deficiencies (mainly information processing speed (IPS) and memory) which occur at the early stages of MS (high-risk clinically isolated syndromes (CIS)). These MRI parameters could be further used to predict the responsiveness of MS patients to cognitive rehabilitation.

Two clinical researches are involved:

- › The SCI-COG program (240K€) study the correlations between cognitive disorders and markers of brain disconnection in MR imaging.
- › The REACTIV program (240K€) studies the cognitive rehabilitation in Multiple Sclerosis and assessment by neuroimaging. This study promoted by CHU de

Bordeaux is on-going.

Added value of TRAIL funding :

- › Project part of Clinical Research protocols : SCI-COG and REACTIV funded by Teva, ARSEP and Merck-Serono laboratories

Current scientific activities and results:

- › A Bio imaging Engineer (Fanny Munch) was recruited to use/ to program Software (SPM, FSL and freesurfer) for imaging processing. The imaging analysis protocol on the lesion segmentation method was implemented. In the SCI-COG study, 17 patients with a clinically isolated syndrome and 5 healthy volunteers were included. A rate of 5 patients and 5 healthy volunteers included per month was expected. As part of the REACTIV study, 10 patients and 19 healthy volunteers have been included.

#### 3-Focusing on microscopic water movements and diffusion-weighted imaging

IBIO - NI : Imaging Biomarkers of experimental and clinical neuroinflammation

251,036€

IBIO - NI proposes to study

(1) lateral diffusion along the astrocyte membrane of a water channel protein, aquaporin 4 (AQP4), and its regulation; (2) microscopic water movements within cells during focal brain inflammation induced by pro-inflammatory cytokines in order to identify new biomarkers for tissue integrity characterization using new high-sensitivity Diffusion Tensor Imaging (DTI), MR Diffusion kurtosis Imaging (DKI) and Diffusion Spectrum Imaging (DSI). Water movement through AQP4 is one of the biological substrate that underlies MR signal modification with the diffusion-weighted imaging technique; (3) the mechanisms of cognitive impairment in MS using DTI, fMRI and Voxel based morphometry (VBM); (4) large cohorts of MS patients (OFSEP) and controls (I-Share) to validate MRI markers.

Partners of IBIO - NI are :

- › TRAIL teams: U1049 INSERM (K. Petry); Brochet, Tourdias, Ruet, Deloire, Dousset, Petry ; CNRS UMR 5536 (Franconi): Hiba, Konsman
- › Non TRAIL teams: CNRS UMR 5297 (Choquet) Groc ; U862 INSERM (Plazza) Olié ; U708 INSERM (Tzourio): Tzourio, Kurtz

Added value of TRAIL funding :

- › Collaboration with Teva; InterLabEx project (with BRAIN); Impact on the recruitment of doctorants, ATER, Research Engineers

Current scientific activities and results :

- › A postdoctoral fellow, Silvia CIAPPELLONI, was recruited in November 2013 to perform the cultures of hippocampal neurons. A collaboration with Pr Honorat (Inserm U1028/CNRS5292, Lyon) was initiated for the use of a human antibody against Aquaporin-4 (AQP4) to study the activity dependence of AQP4 diffusion and its coupling with GLT-1.
- › Development of DSI sequence (Q space) and animal model in order to identify novel biomarkers based on water diffusion parameters allowing a better characterization of tissue alterations during local inflammation in white and gray matter. Recruitment and evaluation of MS patients in the OFSEP cohort and of controls in the i-Share cohort to understand whether voxel-based cerebral morphometry measures differ in patients with MS according to the presence and severity of depression compared with healthy matched controls.

#### 4- Focusing on molecular imaging of astrocytic lactate in brain activation and hypoxia

InNES : Role of astrocytic lactate in neuronal metabolism: implication during brain activation and neuroprotective effect in neonate cerebral hypoxia.

149,971€

The aim of InNES project is to characterize a lactate shuttle between astrocytes and neurons during brain activation. Ex vivo experiments aim at directly analyzing metabolism on brain biopsies using Nuclear Magnetic Resonance (NMR) at High Resolution at the Magic Angle Spinning (HR-MAS) spectroscopy after perfusion of <sup>13</sup>C-labeled substrates in awake rats in activated conditions and in rats in which MCT2 (neuronal monocarboxylate transporter) is silenced (to determine the role of MCT2 in the transfer of astrocytic lactate to neurons). In vivo experiments aim at following in real-time brain lactate by localized NMR spectroscopy and molecular imaging of lactate at 7T during stimulation. Experiments on neonate model of brain hypoxia will study lactate administration as a neuroprotective therapeutic tool.

Added value of TRAIL funding :

- › Development of scientific basic knowledge's in neuroscience and in vivo spectrometry
- › Translational research (collaboration with J-F. Chateil (Children hospital, Bordeaux))
- › International collaborations and attraction for top-notch neuroscientists: L. Pellerin from Lausanne, who was a pioneer in the ANLSH theory and G. Bonvento working in MIRCen lab (CEA, Fontenay-aux-Roses) directed by P. Hantraye.

Current scientific activities and results :

- › The air puff system for whisker stimulation in and outside the magnet was constructed. Cerebral activation was visualized by autoradiographic images of control and MCT2 -down regulated rats. <sup>1</sup>H- and <sup>13</sup>C-NMR spectra and specific enrichments of metabolites in the activated and non-activated barrel field samples of control and MCT2 -down regulated rats clearly indicate an increase in intracerebral lactate production from blood glucose during neuronal activation. No increase of lactate can be demonstrated in rats MCT2, showing for the first time the role of MCT2 in the metabolic coupling between neurons and astrocytes.

The NMR spectra acquired at 7T in control rats show an increase in lactate during activation, no longer detected in rats lacking MCT2. In vivo experiments conducted in InNES project determine lactate coming from the astrocytes as an important neuronal energetic substrate. An important and promising outcome concerns neuroprotective strategies. Indeed, functional brain imaging has shown that several neurodegenerative diseases are characterized by metabolic impairments that often precede the onset of the symptoms.

#### 5- Focusing on molecular imaging of biomarkers of atherosclerosis using human antibodies

MIMATHUMAB: Molecular IMaging of ATHeroma with HUMAN AntiBody  
195,000€

MIMATHUMAB project focuses on molecular imaging of atherosclerosis, using human antibody discovery for high quality functionalization of nanoparticles dedicated to safe and non-invasive magnetic resonance imaging (MRI) or magnetic particle imaging (MPI) and for radiolabeling with <sup>18</sup>F or <sup>68</sup>Ga for positron emission tomography (PET). Nowadays, there is an increasing interest in molecular imaging of atherosclerosis, in order to assess the cellular components that underlie the risk of rupture of vulnerable plaques, precipitating the clinical conditions of stroke and myocardial infarction. Molecular imaging requires highly sensitive and specific affinity ligands for targeting. MIMATHAMAB project aims to (1) engineer recombinant human single chain Fv (scFv) antibodies (Abs) designed to target vulnerable plaques, (2) functionalize imaging devices with scFv antibodies, (3) achieve molecular imaging by MRI, MPI and PET on new ApoE-/- mouse models of atherosclerosis and plaque rupture.

Partners of MIMATHUMAB are:

- › TRAIL team: UMR 5536, Molecular Targeting of Atheroma Group;
- › Non TRAIL Teams: UPR 9048, ICMCB (E. Duguet: AMADEus); Baker IDI Heart and Diabetes Institute (C. Hagemeyer)

Added value of TRAIL funding :

- › Translational research: a panel of human Abs using in vivo phage-display technology selected in animal models were shown to target human atherosclerotic tissues, thus likely to be used from pre-clinical to clinical studies. If some of these human antibodies were shown to recognize biomarkers involved in inflammation, these could be easily translated to other systemic pathologies, such as neurological disorders and cancers; InterLabEx project (with AMADEus); International collaboration with Baker IDI Heart and Diabetes Institute leading to an IdEx grant for PhD; Project part of GDR n° 3260 "Anticorps et ciblage thérapeutique", FLI (France Life Imaging) WP1; Leverage of additional funds: ANR ATHERANOS, CRA doctoral fellowship, IdEx funding; Leverage of industrial partnerships: LFB Biotechnologies (Rémi Urbain), Brüker Biospin MRI GmbH (Nicoleta Baxan ; MPI technology)

Current scientific activities and results :

- › Human antibodies (Abs) previously selected by phage display have been produced in large-scale in Pichia Pastoris, insect cells, mammalian cells under different Ab formats (ScFv, scFv-Fc, scFv-Fab'2, IgG) to meet the needs for efficient grafting to imaging agents. IgG and scFv Abs have been used to functionalize Versatile USPIO (VUSPIO) nanoparticles for MRI and MPI applications. Different platforms of scFv-VUSPIO were constructed, increasing the number of scFv grafted per VUSPIO . Reactivity was found to be gradually improved in fonction of the number of Abs. High-resolution ex vivo MRI and fluorescence approaches (ViVoptic platform)

demonstrated a selective binding of Ab-VUSPIO on murine atheroma plaques. Promising preliminary in vivo MRI studies will be improved with the recruitment of a post-doctorant via TRAIL funding. PET studies will be performed with 68Ga-labelled Abs. The biotechnologies developed around these human Ab will constitute the basis for developing new clinical tools dedicated to molecular imaging and therapy of human atherosclerosis in collaboration with LFB Biotechnologies, a new partner of the ANR project ATHERANOS.

#### 6- Focusing on fluorescence and ultrasound imaging of small prostate tumors

BiopsyProstaProbe : Development of antibody-based fluorescence probe for biopsy guidance of prostate cancer 35,000€

BiopsyProstaProbe proposed to combine fluorescence imaging to the ultrasound imaging currently used in clinic, in order to detect small prostate tumors making possible to guide the transrectal biopsy . The goal of the current project is to develop a fluorescent probe based on a labeled antibody, a scFv anti-PSMA antibody, provided by Italians collaborators . This scFv is known to specifically targeted in vivo subcutaneous tumor in mice. To test the probe in physiopathological context as close as possible of clinical conditions, the project proposed to develop a prostate cancer model using mouse RM1 cells in immunocompetent mice. RM1 cells will be genetically modified to express both human PSMA and imaging reporter genes in order to test labeling specificity. Completion of the current project will open avenue for translational application of ScFv fragment for biopsy guidance of prostate cancer.

That's why this innovative way of the project has appeared in directly coupling the scFvD2B fragment to a near infrared fluorophore.

Partners of BiopsyProstaProbe are:

- › TRAIL team: RMSB, UMR 5536, équipe Imagerie & Cancer, F. Couillaud & N. Grenier
- › Non TRAIL team: University of Verona, Italy, G. Fracasso & M. Colombatti

Current scientific activities and results :

- › The project will start with the recruitment of MAZZOCCO Claire in January 2015

General Conclusion:

Learning from physiological, cellular or molecular events occurring in pathologies to predict disease progression, prognosis and evaluate therapeutic intervention will continue to be the major axes of WP5. Targeting cellular or molecular events for such purposes implies the development of targeted contrast agents and a closer link with projects developed in WP4.

## WP6: mathematical simulations and modeling

The general aim of this work package is to couple modeling tools from computer science and mathematics with imaging modalities in order to exploit all the information included in the images. In order to optimize the resources and to create new synergies, we drive this program jointly with the cluster CPU of the IDEX Bordeaux <http://cpu.labex.u-bordeaux.fr>. The goal of CPU is to develop digital sciences and their applications to other sciences. CPU is organized in three axes (scientific computing; signal and image processing; reliability, networks and data management). The three axes contribute to the TRAIL program and there is a growing community of researchers that are concerned with this interaction through the WP 6 of TRAIL. Concerning specifically WP6, we have mainly focused on three aspects:

**i)** The first one is the use of longitudinal, multi-modal data in oncology. The goal is to be able to obtain patient specific predictions of the evolution of a lesion or the response to a treatment using morphologic image (like CT-scans or MRI) and functional imaging (perfusion MRI, TEP F-miso...). Special care will be given to the evaluation of the effects of anti-angiogenic therapies for the renal cell carcinoma. We will take advantage of the presence in Bordeaux of specialists of clinical oncology, functional imaging, biologists and mathematicians in order to enhance the translational aspect of this study.

**ii)** The second aspect concerns representation, simulation and statistical modeling of multivariate, multimodal, neuroimaging data. Cohort studies including neuroimaging data have become one the most advanced tool of modern neuroscience. Such studies usually combine acquisition in large groups of subjects of multivariate data, namely socio-demographic, lifestyle, biological including genetic, psychometric, and multimodal neuroimaging, including structural, functional, metabolic and molecular. The objectives of these studies maybe,

for example, the understanding of the relationships between brain and behavior, uncovering the risk factors of some disease, or improving current diagnostic methods. These multiple, ongoing or about to start, cohorts ran by TRAIL core and associated teams, offer the unique opportunity of designing and testing the feasibility of mathematical and/or statistical models of brain functioning and of its major disorders.

**iii)** The third point concerns Cardiac electrophysiology numerical modeling based on multimodal imaging information. It is mainly driven by the IHU and even if the researchers are involved explicitly in TRAIL and CPU, we will omit the report on this part that is mainly founded by the IHU.

Below, we give an exhaustive description of the projects that have been founded by TRAIL and CPU in order to show the activity of this new community that has been induced by the two LabEx. These projects are driven jointly by computer scientists, medical doctors and mathematicians in order to achieve the translational mission of TRAIL.

**1) CRYOIMMUNO.** F. Cornelis (CHU), funded by TRAIL. With the CRYOIMMUNO clinical trial, we would like to evaluate the impact of the combination of cryoablation and immune-modulation. We hypothesize that this strategy will confer long-term immunity, and ultimately cure, by exploiting the biology of the tumor and the immune system of the affected individual. We would like to propose clinically this hypothesis in patients who already benefited in routine practice of a cryoablation and required the development of novel therapeutic strategies in order to improve the standard of care and life expectancy. To adequately validate this hypothesis, our study requires developing a reliable methodology of evaluation: imaging and immunologic explorations will assess the therapeutic response and may improve the understanding of the

mechanisms involved.

**2) Bronchial segmentation on MRI.** F. Baldacci (LaBRI) and F. Laurent (CHU). The main goal of this project is to develop new image analysis methods aiming to enable the use of MRI for characteristic measurements of bronchial diseases. Those measurements are only available on CT scan data up to now. The work is divided in two parts:

- › Noise reduction of the MRI image by frequential filtering in k-space before reconstruction plus a geometrical filtering on morphological image.
- › Lumen and bronchial wall segmentation in order to do a quantitative analysis of the bronchial tree.

The long-term goal of this work is to realize some diagnostics without requiring ionizing acquisition technique.

**3) Advanced statistical methods** for analysis of multidimensional databases of human brain imaging B. Mazoyer (GIN), J. Sarraco (INRIA). Funded by IDEX on the interlabex problem.

The project focuses on the analysis of variability factors driving hemispheric specialization (HS) of the brain, a human specific character, for which a dedicated database has recently been built by GIN ((Neurofunctional Imaging Group from L).

GIN provides the database and performs genotyping of fifty loci potentially affecting HS. The "Probability and Statistics" group (EPS) from the LabEx CPU works on the methodological developments of statistical tools (dimension reduction approaches, clustering, statistical modeling) to analyze these high dimensional data. Interactions between GIN and EPS allow to identify and to characterize the best variables, to perform additional analyses, and to suggest appropriate additional variables, especially in the case of the voxel being implemented. GIN is also involved in the interpretation of the statistical results

generated throughout the project.

Dr Solveig Badillo has been hired as Postdoctoral researcher in may 2014 on this project for 20 months.

**4)** Derivation of a phenomenological predictive mathematical model of hippocampal activity. A. Iollo (INRIA), G. Marsicano (Magendie), funded by CPU. One of the most daunting challenges in neurosciences is the ability to visualize and quantitatively analyze the activity of defined intact neuronal circuits. In this project we plan to use advanced experimental methods and novel numerical models based on partial differential equations (PDEs) to provide a systematic interpretation and modeling of distributed neuronal activity information.

The main source of experimental data is Voltage-sensitive dye imaging (VSDI). This technique offers the great advantage of direct visualization of dynamic neuronal activity in acute brain slices in physiological and pathological conditions. The dynamic images provided by this technique could in principle be analyzed by conventional point-wise statistical methods. However, considering the spatial nature of the time-resolved data available, we have the possibility to provide a much deeper understanding of the distributed neuronal activity observed thanks to VSDI data. To this aim, we have developed a computational method based on the solution of an optimal transportation problem that is used to derive precise information on velocity fields, direction, spatial spreading and morphological constraints of stimulated neuronal activity in hippocampal circuits. This approach represents a novel and rational method to obtain several specific parameters describing in detail the modes of diffusion of depolarization signals in brain slices.

Thanks to this model-based VSDI data analyses, we study specific mechanisms of depolarization signal diffusion in the hippocampus and build a phenomenological PDE model of these events. We chose to use advanced genetic and pharmacological tools to interfere

with the activity of specific (CB1) receptors, in order to build an experimental database to derive a phenomenological predictive mathematical model of hippocampal activity based on VSDI data. An engineer will be hired in 2015.

**5)** MOD. Th. Colin (INRIA), F. Cornelis (CHU), J. Palussière (Bergonié), funded by TRAIL, co-funding by the Région Aquitaine. The aim of this project is to propose mathematical models for evaluating the response to anti-angiogenic drugs using functional imaging. The ultimate goal of this approach will be to be able to propose numerical tools in order to predict the evolution of the growth of a tumor or its long-term response to a treatment using the early response, measured through functional imaging.

The methodology is the following one: we start by writing a mathematical model (using a set of partial differential equations) that relies on a mechanistical description of the tumor growth. Usually, this model will involve a set of "free" parameters (less than 10) that are unknown and to be determined. Then we check that this model is able to describe, at least qualitatively, the behaviors that are observed on longitudinal series of CT-scans or MRI. At this point two strategies are available:

a) The first one consists in trying to describe the features of the image (as for example the texture of the image of the tumor) through the model in order to explain the effect of the drugs. For example, it is well known that the effect of anti-angiogenic drugs may not only be observed on the change of shape of the tumor but also on its constitution. Using series of longitudinal data, we will try to highlight new numerical markers evaluating the long-term response to the therapy.

b) The second approach will be to provide patient-specific prognosis: we try to find the «best» values of the parameters that allow to match with the series of imaged by solving an optimization problem; then we make a prediction using this set of parameters. This strategy has been successfully used for evaluating the

aggressiveness of lung metastases without treatment in the team MC2 of T. Colin.

We will develop this methodology in two directions. The first axis is devoted to NSCLC and brain metastasis and the second one to kidney cancers and lung metastasis. We will develop below the specificity in terms of imaging of both axes.

A. Peretti has been hired as PhD student (co-funded by the region) in October 2014.

**6)** Abnormality Detection using Sparse-based Modeling of Brain Anatomy: Application to Alzheimer's Disease. P. Coupé (LaBRI), M. Allard (INCIA), funded by CPU. The detection of anatomical abnormalities of brain characteristics between a studied population and the normal anatomy is an important aspect of current research on brain. Automatic detection of such abnormalities enables to link structural brain changes to cognition scores or clinical symptoms. In this project we propose: (i) to present the new concept of sparse-based morphometry (SBM) to better represent the complexity of local anatomical pattern, (ii) to combine voxel-based morphometry (VBM) and SBM in order to simultaneously analyze modification of local mean of gray matter (GM) density and alteration of shape and geometry of local GM pattern, and (iii) we evaluate the propose framework on the ADNI dataset (N=814).

Dr Thach Thao Duong has been hired as Postdoctoral researcher the 1st October 2014 on this project for 14 months.

**7)** Toward an in-vivo ultra-high resolution diffusion MRI platform: Application to multiple sclerosis. P. Coupé (LaBRI), T. Tourdias (Magendie). Funded by CPU. Diffusion weighted (DW) imaging enables the reconstruction of information revealing the microstructure of the brain. Despite its interesting properties, DW imaging is an inherently low signal-to-noise ratio (SNR) technique and yields to relatively poor spatial resolution.

In this project we will propose new denoising and super-resolution methods to enable ultra-high resolution (UHR) DTI. Such UHR DTI can enable a new in-vivo insight of brain architecture and can be useful for a large range of pathologies. Moreover, we will develop a fully automatic platform for UHR DTI in order to process the large amount of data produced by our collaborators. Finally, a validation of the proposed platform will be carried out on a large dataset of patient with multiple sclerosis.

This project did not start yet. A co-funding LabEx BRAIN proposed by T. Tourdias has been accepted on this topic.

**8) Kidney.** N. Grenier (CHU), Th. Colin (INRIA), B. Taton (CHU and INRIA). Funded by CPU. While

renal function value and trends determine nephrologists' all-day therapeutic decisions, the tools used to assess these quantities still require improvements. Magnetic Resonance Imaging (MRI) allows the functional evaluation of anatomic zones of the kidney. In renal functional MRI (fMRI) the kidney is modeled as compartments between which substances are exchanged. These flows may be assessed by studying the kinetics of the MRI signal following gadolinium injections. Topographic maps of renal blood flow, blood volume, glomerular filtration rate and other parameters of interest may be derived from these models. In chronic kidney diseases, the physiological status of each kidney zone might be evaluated.

Models for the prediction of tumoral growth may be enriched to account for physiological

knowledge concerning the kidney. The algorithms used to estimate the parameters of the resulting partial differential equations remain valid and may be fed with the functional maps obtained by fMRI studies. This work intends to provide clinicians with new tools to investigate topographic maps of the renal function and predict its evolution. B. Taton (MD) has been hired as post-doc since nov. 2014.

**9) Meningiomas.** O. Saut (INRIA, H. Loiseau (CHU), G. Kantor (Bergonié). Funded by CPU. To start in 2015. We plan to run on meningioma the same program than that we have on lung metastasis. The aim is to estimate the growth in the future using a longitudinal sequence of MRI of one patient. An engineer will be hired in 2015.

## WP7: cohort imaging methodology

The main streamline of TRAIL-WP7 research is the development of advanced automated algorithms for processing large image datasets produced by cohort studies.

Five projects have been funded by TRAIL since 2011.

TRAIL&TRACKS is a stem-based tractography algorithm for DTI

data that has been developed and is in a validation phase. ABACI is a neuroanatomical analysis pipeline, now in its final development phase, that is already implemented and used for processing the MIBRAIN cohort. The 3 other projects have just started : COBRASCAN aims at developing quantitative CT analysis of lung parenchyma analysis for the

COBRA cohort, while ABACI2 and PACA will extend the ABACI pipeline for processing intrinsic FMRI data and developing a probabilistic atlas of cortical areas, respectively.

Also falling within WP7 framework is the organization of an international summer school dedicated to methods in CONNECTOMICS.

## International Master BioImaging

The objective of this training is to master theoretical concepts and practical know-how of the main bio-imaging techniques.

The Master is supported by 2 LabEx: LabEx BRAIN (Bordeaux Région Aquitaine Initiative for

Neurosciences) and LabEx TRAIL (Translational Research and Advanced Imaging Laboratory). Researchers from LabEx BRAIN will teach neurosciences, including cellular imaging, and researchers from LabEx TRAIL will teach medical imaging. The

Master was launched in 2012 and had 15 students in 2013 and 10 in 2014.

# Annex 4

## Two imaging platforms in Bordeaux:

### a) UMS - CNRS-3428

### Démarches

#### 1 Rencontre et discussion avec l'équipe

- État des lieux du projet
- Pertinence et adéquation de notre savoir faire avec les besoins exprimés
- Concertation pour :
  - définir les paramètres à mesurer et à observer
  - les étapes de mise au point à prévoir (un protocole de développement a été déposé auprès du CNRS pour tester des séquences sur des volontaires sains)

#### 2 Finalisation de l'écriture du projet

- Aide méthodologique pour l'élaboration de la partie imagerie
- Conseil pour la rédaction du support du projet
- Mise en place du projet et son suivi
- Devis

#### 3 Dépôt/ déclaration administrative

- Déclaration du projet sur la plateforme
- Validation par la direction
- Contrat cadre liant l'université de Bordeaux et son client

#### 4 Réalisation du projet

- Prestations réalisées dans le respect d'un cahier de procédures
- Prise de rendez-vous pour occupation de la machine
- Formation sur systèmes optiques et IRM
- Accompagnement par un expert pour l'acquisition des images
- Annulation
- Facturation trimestrielle

#### 5 Aide au traitement des données

- Demande d'un expert pour superviser
- Écriture du cahier des charges pour déterminer la procédure d'analyse d'images
- Analyse d'images

#### 6 Finalisation

- Clôture du projet et des comptes

### Contacts et heures d'ouverture

Du lundi au vendredi de 9 heures à 17 h 30.

Directeur de la plateforme : Vincent Dousset

Anne Thevenoux  
 06 26 15 35 82 > [anne.thevenoux@u-bordeaux.fr](mailto:anne.thevenoux@u-bordeaux.fr)

Dominique Richard  
 05 57 57 95 45 > [dominique.richard@u-bordeaux.fr](mailto:dominique.richard@u-bordeaux.fr)

**Accès**

Tram A > arrêt Pellegrin ou Saint Augustin  
 Ligne 11, ligne 8 : arrêt Pellegrin

**Tarifs**

## 14 Steering Committee members

### TRAIL DIRECTOR

Vincent DOUSSET
-----------------

### LABORATORIES'REPRESENTATIVES

Institute of Molecular Sciences (ISM, UMR5255)	Éric FOUQUET
Centre of Magnetic Resonance of Biological Systems (RMSB, UMR5536)	Jean-Michel FRANCONI
Bordeaux Cardio-Thoracic Research Centre (CRCTB, U1045)	Patrick BERGER
"Physiopathology of neuronal plasticity" Inserm unit (Magendie Institute, U862)	Bruno BROCHET
Aquitaine Institute of Cognitive and Integrative Neurosciences (INCIA, UMR5287)	Michele ALLARD
Neurofunctional Imaging Group (GIN, UMR5296)	Bernard MAZOYER
Bordeaux Institute of Mathematics (IMB, UMR5251)	Thierry COLIN
"Neuroinflammation, imaging and therapy of multiple sclerosis" Inserm unit U1049	Klaus PETRY

### MEDICAL FIELDS'REPRESENTATIVES

Neurology	Bassem HIBA
Oncology	Jean PALUSSIÈRE
Cardiology	Bruno QUESSON
Pneumology	François LAURENT
Nephrology	Nicolas GRENIER

# Annex 6

Presentation to IDEX Bordeaux by Director of TRAIL, june 2014

**TRAIL**  
Public health issues and  
role of imaging

université  
de BORDEAUX

## Public health issues

- Aging of population and evolution of environmental factors go hand in hand with increased risk of diseases:
  - Cardiovascular diseases (heart attack, stroke...)
    - 17 M of deaths, 30% of world wide mortality (WHO)
  - Cancer (lung, colon, breast, stomach, liver)
    - 8.2M of deaths
  - Respiratory diseases (lower respiratory tract infections, COPD)
    - 6.2M of deaths
  - Neurological disorders (Alzheimer, Parkinson, MS, neuroinfection) :
    - 6.6M of deaths
- These public health risks and their economic impacts are attracting the attention of public policymakers and will increase the need for prevention, diagnosis and personalized therapeutic monitoring

## Role of imaging

- Diagnosis
- Surgery guidance
- Treatments monitoring (imaging biomarkers)

## Imaging benefits

- Non invasive
- Prevention
- Personalized medicine
- New treatment evaluation
- High industrial valorization potential (G.E., Siemens, Philips, bcp de PME)

**TRAIL**  
Today

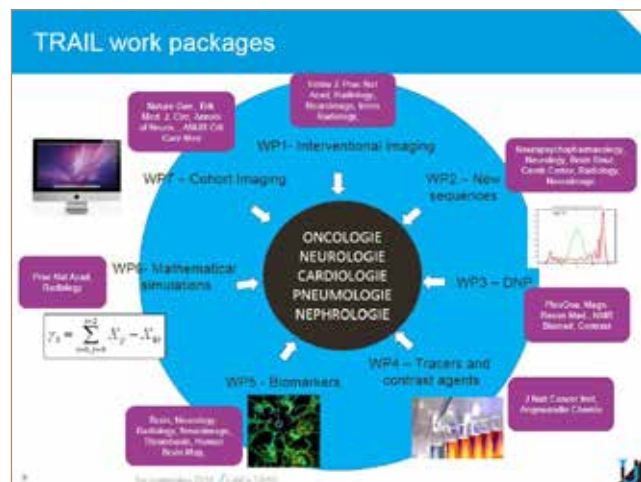

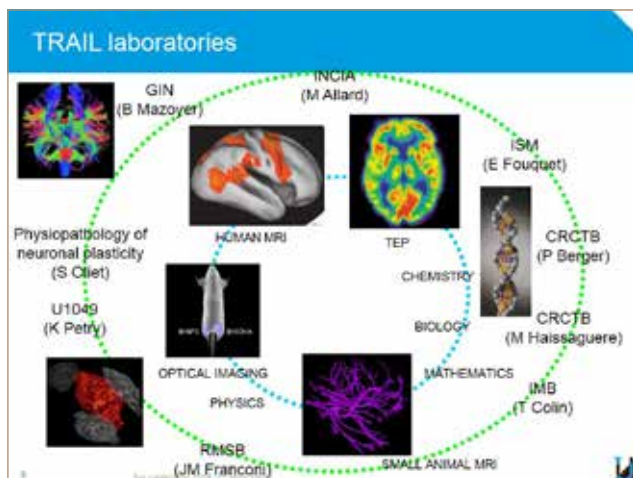

université  
de BORDEAUX

## TRAIL laboratories

→ 8 laboratories from Bordeaux involved in:

- Public health issues
- Cross-sectional research
- Translational research

### Bio Imaging platform (UMS3428-IBIO)

- 6 optical systems
- 3 small animal MRI (7,05T, 4,7T, 0,2T)
- 3 human MRI (0,2T, 3T)
- 2 HIFU systems
- 1 TEP-TDM

Plateforme de Bio-Imagerie en sciences médicales  
Center for Biomedical Imaging Research

### TRAIL 2011-2013 developments

→ Research

- 3 calls for proposals, 20 research projects granted
  - 2,34M€
  - All federative projects received a double « A » grade from international reviewers
- 12 new collaborators
  - 3 post-doctoral fellowships, 7 doctoral fellowships, 2 engineers
  - Coming from: Australia, Canada, France, Italy
- 19 academic collaborations
  - UTAH, Boston, Stanford, Sherbrooke, Amsterdam, Wisconsin, New York, Valencia, Lauterzahn, Washington
  - Building of a national network with « FLI » (Paris, Grenoble, Marseille, Lyon, Toulouse)
- 5 projects financed by IDEX
  - 1 InterlabEx project: Labex TRAIL - Labex CPU : 134K€
  - 3 International post-doctoral fellowships: 150K€
  - 2 Mobility grants:
    - Thomas Costello (E Fouquet - Sherbrooke, Canada) 350 K€
    - Justin Hsu (J. Petit - Canada Sherbrooke, 1 month) 300 K€
  - 3 invited professors:
    - Dr. Charles Gnanou (University of Toulon, USA); Dr. David Parker (University of Utah, USA); Dr. Mehdi Tadjine (University of Bordeaux, France); Dr. Toshiaki Saito (University of Tokyo, Japan)
  - 2 Summer school projects

## TRAIL 2011-2013 developments

### → Cofunding:

- Public funding 2012-2013 : 2.9M€
  - ANR, Plan Cancer, ITN PI Net, AGSEP, Idex Bordeaux
- Industrial funding 2012-2013 :
  - 630K€ (TEVA, Merck Serono, Unither, Sanofi, GSK, Intrasec)
  - Engineers made available for TRAIL projects by Siemens, Bruker, Philips, IGT SA

### → Dissemination

- 25 talks in international congresses (Japan, Argentina, Germany, India, Croatia, USA, Spain, France, ...)
- 5 international speakers in Bordeaux in 2013 coming from the CITA/Alzheimer Center Spain, the Johns Hopkins University USA, the University of Pittsburgh USA, the University of Oxford
- A symposium in Bordeaux « Image guided therapy and diagnosis » in 2013

### → Training

- 2 Seminars in 2012
- 2 Summerschools projects (Connectomics 2014, Neuroinflammation Imaging 2015)

16

1er septembre 2014 / Labex ITRAIL

## TRAIL 2011-2013 developments

### → Governance

- Calls for proposals
  - 4 calls for research projects, 2 calls for post doctoral fellowship
  - 42 reviewers (2011-13)
  - 20 research projects (2.34M€)
- 25 Steering Committee
- 1 « Comité des Tutelles »
- 1 Scientific Advisory Board (nov 2014)
- 1 Consortium Agreement

16

1er septembre 2014 / Travaux de concertation

# TRAIL 2011-2013 developments

## Strengths

- Major public health themes: neurology, oncology, cardiology, pneumology, nephrology
- Multidisciplinarity on the same site (chemistry, biology, imaging, mathematics), collaboration clinician-researchers
- Performance of teams: grades A+/A from the AERES assessment agency, 48% of scientific articles from the TRAIL community are published in journals with an impact factor over 5
- 2 technological platforms (UMS-CNRS-3428, PTIB) and one dedicated building (IBIO, in 2014)
- A lasting budget of 9M€ over 9 years (2011-2019)
- Attractiveness: academic collaborations, industrial collaborations, institutional co-financing, post-doc and doctoral student recruitments
- Large community: 170 people (86 researchers, 17 postdocs, 25 engineers, 24 doctoral students, 8 technicians, 10 administrative staff)
- Training programs: 2 summer schools, International Bioimaging Master's Program, links with the School of Neurosciences FENS-IBRO
- Strong governance: Consortium Agreement, monthly meetings of the Steering Committee,

## Weaknesses

- Numerous research subjects: 7 work packages et 5 medical fields
- Industrial development
- International visibility
- Varied communities
- Protectionism regarding the composition of the LabEx
- Recruitments to be made lasting over time

## Opportunities

- Aligning research with national, international and European research strategies (H2020/ Kic ageing)
- Varied research ecosystem: Pellegrin CHU, Institut Bergonié (oncology), ISPED (epidemiology), Neurocampus, Institut National de Recherche en Informatique, Laboratoire Bordelais de Recherche en Informatique, Institut Hospitalo Universitaire LYRIC (cardiology) and Equipex MUSIC, ARNA (study of RNA), LabEx,
- UMS-CNRS-3428 platform, regional node for France Life Imaging
- Historical support from the Conseil Régional d'Aquitaine (co-financing of equipment and research projects, communication), regional networks: Cluster TIC SANTE (1<sup>st</sup> health computer cluster in France), Route des Lasers, BIPSA
- Growth strategy of the University of Bordeaux: merging of 3 universities, connecting with the Université du Pays Basque, IDEX Bordeaux, ranking in the international classification of universities
- the Aquitaine region is attractive for international relations; « Euroregion » (Aquitaine-Pays Basque)
- CPER 2014-2020

## Threats

- Competitive themes
- Cost of equipment (maintenance, renewal)
- Regional and national industrial imaging scene
- Structure of the next five-year research plan

## TRAIL Translational research

# Annex 9

## Comparison between TRAIL objectives and first results

OBJECTIVES (2011-2019)	RESULTS (2011-MID 2014)
Improving imaging science	<ul style="list-style-type: none"><li>› 23 research projects covering 80% of the medical themes and 100% of the work packages of the TRAIL research matrix</li><li>› 9,4M€ dedicated to research over 2 years (TRAIL: 3,164M€; co-financing: 6,2M€)</li><li>› 100% federative projects graded « A » by external reviewers; 48 international reviewers mobilized since 2011</li><li>› 202 publications of the community on TRAIL research themes since 2012, 11 international speakers in Bordeaux, 21 academic collaborations</li></ul>
Developing translational research	<ul style="list-style-type: none"><li>› Translational research projects</li><li>› The CHU and the Institut Bergonié support clinical trials</li><li>› The Steering Committee is composed of researchers and clinicians</li></ul>
Interacting with the industry	<ul style="list-style-type: none"><li>› 15 industrials involved in TRAIL research projects</li><li>› 551K€ of direct financial contribution from the industry</li><li>› Collaboration with the SATT, the Conseil Régional d'Aquitaine (Aquitaine Développement Innovation, Cluster TIC Santé, Route des Lasers), and with the Bordeaux University Foundation for the showcasing of TRAIL in regional and national industry</li><li>› Communication media (internet website, brochures, kakemono), and promotion of the LabEx to industrialists (RSNA 2012, ISMRMB 2013, JFR 2012/2013, B4B; see annex 15)</li></ul>
Promoting training	<ul style="list-style-type: none"><li>› 202 publications and 150 scientific communication since 2012</li><li>› 1 summerschool in 2014</li><li>› Annual doc/post-doctoral fellowship programs</li><li>› 3 mentoring actions in 2012 (1 seminar, 1 symposium, 1 mobility)</li><li>› 8 trainees in 2 years</li><li>› Links with the Bioimaging Master's Program; links with the FLI network</li></ul>
Establishing a strong governance	<ul style="list-style-type: none"><li>› Consortium Agreement between 5 institutional tutors</li><li>› Monthly Steering Committee (26 meetings), Trustee Committee (1 en 2012), Annual General Assembly (2011, 2012, 2013)</li><li>› Procedures for calls for proposals</li><li>› Annual reporting to ANR, Idex Bordeaux</li><li>› 2 full-time positions dedicated to developing the LabEx</li></ul>

# Annex 10

## Recruitments and community

### a) Recruitments

2011-2013 RECRUITMENTS				
Function	Name	Beginning of contract	End of contract	Project
3 Post Doctoral fellowships	Emeline RIBOT	2014	2018	NEWFISP (Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases)
	Pierre-Yves HERVE	2013	2013	ABACI (Automated Brain anatomy softwares for cohort imaging)
	Silvia CIAPPELLONI	2013	2015	IBIO-NI (New Imaging Biomarkers of neuroinflammation such as MS)
2 Engineers	Gaelle LEROUX	2013	2013	ABACI (Automated Brain anatomy softwares for cohort imaging)
	Fanny MUNSCH	2012	2015	SCICOG REACTIV (Imaging biomarker in MS)
7 Doctoral fellowships	Charles CASTETS	2013	2016	NEWFISP (Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases)
	Laurent ADUMEAU	2013	2016	MIMATHUMAB (Molecular Imaging of Atheroma with Human Antibody)
	Mélusine LARIVIERE	2013	2016	MIMATHUMAB (Molecular Imaging of Atheroma with Human Antibody)
	Thomas CORNILLEAU	2013	2016	PIAF (18F for PET-imaging angiogenesis)
	Aurélien TROTIER	2012	2015	NEWFISP (Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases)
	Janice HAU	2012	2015	TRAIL&TRACKS (Atlasing white matter tracts)
	Neha KOONJOO	2012	2015	TRAILDNP (To improve in vivo DNP in mice at 0.2 T)
8 Master Trainees	Laurie VEREMES	2013	2013	ACTE (Cognitive training and brain functional connectivity)
	Tom DURIEZ	2013	2013	NEWFISP (Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases)
	Kris VAN RENTERGHEM	2013	2013	NEWFISP (Improving MRI resolution to correctly MRI-diagnose cardiac pathologies and metastases)
	Denys SAMPOL	2013	2013	INNES (Lactate and neuronal metabolism)
	Alexandre POUSSARD	2013	2013	MIMATHUMAB (Molecular Imaging of Atheroma with Human Antibody)
	Aude GUILLEMET	2013	2013	PIAF (18F for PET-imaging angiogenesis)
	Annie RUELLE	2013	2013	PIAF (18F for PET-imaging angiogenesis)
	Charlène DUPRE	2013	2013	IBIO-NI (New Imaging Biomarkers of neuroinflammation such as MS)
2 Administrative staff	Jean-François BAUGER	2011	2015	TRAIL GOVERNANCE
	Iris LEMOINE	2012	2015	TRAIL GOVERNANCE

### b) Community

#### Number of persons per laboratory

LABORATORY	NUMBER OF PERSONS	%
U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)	52	31%
UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)	37	22%
UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)	31	18%
UMR 5296 (GIN: Neurofunctional Imaging Group)	18	11%
INSERM U1049 (Neuroinflammation, imaging and therapy of MS)	11	6%
UMS 3428	10	6%
UMR5255 (ISM: Bio-active molecules and synthesis team)	9	5%
INSERM U862 (Magendie Institute: Pathophysiology of neuronal plasticity)	2	1%
Total	170	100%

## Detailed listing of TRAIL persons (end of 2013)

TRAIL COMMUNITY			
NAME	PRENOM	FONCTION	ORGANIZATION
ADUMEAU	Laurent	Doctoral Fellowship	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
ALLANIC	Marianne	Post Doctoral Fellowship	UMR 5296 (GIN: Neurofunctional Imaging Group)
ALLARD	Michèle	researcher/teacher	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
ALLARD	Benoit	Doctoral Fellowship	UMR 5296 (GIN: Neurofunctional Imaging Group)
ARSAC	Laurent	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
ASSUDRE	Sylvie	Administrative staff	INSERM U1049 (Neuroinflammation, imaging and therapy of MS)
BAUGER	Jean-François	Administrative staff	UMS 3428
BEAUVIEUX	Marie-Christine	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BENOIST	David	Post Doctoral Fellowship	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
BERGER	Patrick	researcher/teacher	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
BERLANDE	M.	Technician	UMR5255 (ISM: Bio-active molecules and synthesis team)
BERNARD	Charlotte	Doctoral Fellowship	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
BERNUS	Olivier	researcher/teacher	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
BEZANCON	Eric	Engineer	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BIRAN	Marc	Engineer	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BOIZIAU	Claudine	researcher/teacher	INSERM U1049 (Neuroinflammation, imaging and therapy of MS)
BONNET	Mélissa	researcher/teacher	UMS 3428
BORDOCHAR	Pierre	researcher/teacher	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
BOSSARD	Jérôme	Administrative staff	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
BOUCHAUD	Véronique	Technician	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BOURDEL-MARCHASSON	Isabelle	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BOUZIER-SORE	Anne-Karine	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
BRISSAUD	Olivier	researcher/teacher	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
BROCHET	Bruno	researcher/teacher	INSERM U1049 (Neuroinflammation, imaging and therapy of MS)
BUDISAVLJEVIC	Sanja	Post Doctoral Fellowship	UMR 5296 (GIN: Neurofunctional Imaging Group)
CARON	Jerome	Engineer	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
CARVALHO	Gabrielle	Post Doctoral Fellowship	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
CASSAGNO	Nadège	Technician	INSERM U1049 (Neuroinflammation, imaging and therapy of MS)
CASTETS	Charles	Doctoral Fellowship	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
CATHELINE	Gwenaëlle	researcher/teacher	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
CAZALET	Jean-rené	researcher/teacher	UMR 5287 CNRS (INCIA: Neurofunctional and Cognitive Imaging Team)
CHAIGNE	Sebastien	Technician	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
CHANSEAU	Christel	Engineer	UMS 3428
CHAPOLARD	Mathilde	Doctoral Fellowship	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
CHATEIL	Jean-François	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)
CHOUKROUN	Marie-Luce	researcher/teacher	U1045 (CRCTB: Cardio-Thoracic Research Center of Bordeaux)
CIAPPPELLONI	Silvia	Post Doctoral Fellowship	INSERM U862 (Magendie Institute: Pathophysiology of neuronal plasticity)
CLOFENT-SANCHEZ	Gisèle	researcher/teacher	UMR 5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)

## Research collaborations

WP	APPLIED MEDICAL FIELD	PROJECT	RESEARCH	YEAR OF CORE PROJECT	LEADER	TRAIL GRANT (3,164M€)	COLLABORATION WITH BOR-DEAUX TEAM	COLLABORATION WITH FRENCH TEAM	COLLABORATION WITH INTERNATIONAL TEAM
7	Neuro	ABACI	Automated Brain anatomy softwares for cohort imaging	2012	MAZOYER (UMR 5296 (GIN))	415 000 €	UMR5287, U1049, U708, U897	-	Washington University USA (HCP)
2	Neuro	ACTE	Cognitive training and brain functional connectivity	2012	CHANRAUD (UMR 5287 CNRS (INCIA))	30 000 €		-	SRI International
5	Onco	BIOPSYPROS-TAPROBE	Development of antibody-based fluorescence probe for biopsy guidance of prostate cancer	2014	COULLAUD (UMR 5536 (RMSB))	35 000 €			University of Verona (Fracasso & Colombatti)
7	Pneumo	COBRASCAN	Quantitative computed tomog. for phenotyping COPD within COBRA cohort	2013	LAURENT (U1045 (CRCTB))	134 448 €			
6	Onco	CRYOIM-MUNO	Cryo immunotherapy of metastatic renal carcinoma	2014	CORNELIS (IMB)	35 000 €	CHU Bordeaux, INCIA, UMR 5164 (CIRID)		
1	Onco	HIFU	Alteration of the blood brain barrier induced by HIFU	2012	PETRY (INSERM U1049)	30 000 €	U1045, UMR5536, UMR5297, U862	-	-
2	Neuro	HRDTI	Developping High-Resolution DTI method	2012	HIBA (UMR 5536 (RMSB))	130 000 €	LABRI	-	University of Sherbrooke, Universidad de Valencia
5	Neuro	IBIONI	New Imaging Biomarkers of neuroinflammation such as MS	2012	BROCHET (INSERM U1049)	251 036 €	UMR5536, UMR5297, U862, U708, CHU Bordeaux OFSEP	Université Aix-Marseille, U1028 Lyon	BICAMS group (Europe, USA), MAGNIMS Network, MS CENTER Amsterdam, Buffalo University NY, Royal Holloway London
4	Onco	IMMELAPT	Detecting tumors using SPECT molecular imaging and optimized aptamers	2012	TOULME (UMR 5287 CNRS (INCIA))	250 000 €	U869 (ARNA), INCIA	LPCML Lyon, UMR5260 Dijon	-
5	Neuro	INNES	Lactate and neuronal metabolism	2011	BOUZIER (UMR 5536 (RMSB))	149 971 €	INCIA	MIRcen Fontenay aux Roses	UNIL- IP Lausanne
5	Cardio	MIMATHU-MAB	Molecular Imaging of Atheroma with Human Antibody	2012	CLOFENT-SANCHEZ (UMR 5536 (RMSB))	195 000 €	UPR9048, U869 (ARNA), AMA-DEUS	UPS3044	Baker IDI Melbourne
6	Onco	MOD	Mathematical modeling of the response to antiangiogenic drugs	2013	COLIN (IMB)	180 000 €	RMSB, CHU, INCIA, Bergonié, U1029		
1	Onco, cardio	MRGHIFU2	Methodological developments for HIFU app. in cardiology and oncology	2013	QUESSON (U1045 (CRCTB))	140 000 €	Bergonié, RMSB, UMR 5234		University of Utah
6	Pneumo	NEKOMRI	MRI sequence for bronchial wall segmentation and analysis	2014	BALDACCII (U1045 (CRCTB))	35 000 €	LABRI		
2	Cardio	NEWFISP	Improving MRI resolution to correctly MRI-diagnose cardiac/onco patho.	2012	MIRAUX (UMR 5536 (RMSB))	250 000 €	LABRI, IMB, U1029, Bergonié, IHU LIRYC	-	UNIVERSITY OF WISCONSIN
3	Onco, neuro, pneumo	ONCOFLUX	Metabolic flux MR imaging in tumors	2013	CREMILLIEUX (UMR 5536 (RMSB))	180 000 €		UJF Grenoble U823	
4	Onco	PIAF	18F for PET-imaging angiogenesis	2011	FOUGUET (UMR5255 (ISM))	164 000 €	UMR5287, UMR5805	EA3035 Toulouse (pharmaco anticancéreux) UMR1037 Toulouse (cancéro)	-
4	Onco	PRITOR	NeuroPeptide Receptors Imaging for TumOR Targeting	2013	HINDIE (UMR 5287 CNRS (INCIA))	30 000 €	Bergonié		INMAS (NewDehli India)
5	Neuro	SCICO-GGREACTIV	Imaging biomarker in MS	2011	DELOIRE (INSERM U1049)	130 000 €	CHU Bordeaux, INCIA	Université Aix-Marseille	Magnims Network, Buffalo University NY, Royal Holloway London
4	Onco	SUPSIFLU	Supported Silyl Fluorination	2013	HERMANGE (UMR5255 (ISM))	30 000 €			
7	Neuro	TRAIL& TRACKS	Atlasing white matter tracts	2011	PETIT (UMR 5296 (GIN))	97 500 €	ISHARE	-	University of Ferrara, Italy
3	Neuro	TRAILDNP	To improve in vivo DNP in mice at 0.2 T	2011	THIAUDIERE (UMR 5536 (RMSB))	142 500 €		UMR6264 Aix Marseille (Chimie)	
5	Neuro	TRANSFEAR	Cerebral structure changes involved in pathological fear recovery	2012	BONNET (INSERM U862)	130 000 €	UMS34285, U862, USR3413 (SANPSY BRAIN)	-	FRIEDRICH MIESCHER INSTITUTE

### INTERNATIONAL SPEAKERS

#### INTERNATIONAL SPEAKERS

DATE	SPEAKER	ORGANIZATION	CONFERENCE	SHANGHAI RANKING
April 2013	Dr Ernesto SANZ-ARIGITA	CITA Alzheimer, San Sebastian	Multidimensional biomarkers for early detection of neurodegeneration	-
July 2013	Professor Jeff W.M. BULTE	The Johns Hopkins University School of Medicine Baltimore	Seeing Cells with MRI	4th
July 2013	Professor Martin MEYER	Department of Psychology, Plasticity and Learning in the healthy aging brain, University of Zurich	Time, speech, and the right hemisphere	38th
November 2013	Professor Yasutaka FUSHIMI	Department of Diagnostic Imaging and Nuclear Medicine – Kyoto University	Cooperation between Kyoto University and Toshiba Medical	28th
September 2013	Dr Wafaa ZARAOUI	University of Marseille	Brain sodium MRI: implications for multiple sclerosis	151-200th
	Dr Franz SCHMITT	Siemens Research and Development	Most recent development of High performance gradients and Ultra High Field	-
	Dr Lori BRIDAL	University Pierre et Marie Curie	Evaluating tumor vascular structure and its response to therapy with pre-clinical contrast-enhanced ultrasound	35th
	Pr Mike MODO	University of Pittsburgh	Image-guided injection and non-invasive monitoring of tissue engineering in stroke	10th
	Pr Constantin COUSSIOS	BUBBL, Oxford University	Real-time passive acoustic mapping of tissue ablation and drug delivery by ultrasound	17th
	Pr Sébastien LECOMMANDOUX	University of Bordeaux	Biomimetic polymersomes, a promising platform towards personalized nanomedicine	201-300th
January 2014	Pr Dennis PARKER	Utah Center for Advanced Imaging Research, Salt Lake City	MRI Guided Focused Ultrasound of the Breast	47th
May 2014	Pr Brian RUTT	Stanford School of Medicine	Neuroimaging at ultra high field	2nd
July 2014	Dr Christopher HAGEMEYER	Vascular Biotechnology Laboratory at Baker IDI in Melbourne	Enzyme-mediated Site-specific Bioconjugation for Molecular Imaging and Drug Delivery	-
September 2014	Pr David PERRIN	Department of Chemistry, University of British Columbia, Vancouver, CANADA	One-step Kit-like Radiofluorination of Peptides and other large molecules	37th

**TRAIL - Translational Imaging Meeting**  
**Image guided therapy and diagnosis**  
 Inscription : [trail@desch@chu-bordeaux.fr](mailto:trail@desch@chu-bordeaux.fr) **Friday 27<sup>th</sup> September 2013**  
 Pôle Juridique et Judiciaire  
 35 place Pey Berland à Bordeaux

**PROGRAM**

- 9:00 - 9:30 \*\*\*\*\* Welcome participants
- 9:30 - 9:45 \*\*\*\*\* Opening session
- 9:45 - 10:30 \*\*\*\*\* Brain sodium MRI: implications for multiple sclerosis  
 Dr Wafaa Zarrouk, Centre de Recherche Magnétique Biologie et Médecine, Marseille
- 10:30 - 11:15 \*\*\*\*\* Evaluating tumor vascular structure and its response to therapy with pre-clinical contrast-enhanced ultrasound  
 Dr Lori Bridal, Laboratoire d'Imagerie Paramétrique - Paris
- 11:15 - 11:45 \*\*\*\*\* Coffee break
- 11:45 - 12:30 \*\*\*\*\* Most recent development of High performance gradients and Ultra High Field  
 Dr Franz Schmitt, SIEMENS Healthcare, Director, MR R&D Europe
- 12:30 - 14:00 \*\*\*\*\* Lunch break
- 14:00 - 14:45 \*\*\*\*\* Image-guided injection and non-invasive monitoring of tissue engineering in stroke  
 Dr Mike Modo, Department of Radiology & Biomedical Engineering, University of Pittsburgh
- 14:45 - 15:30 \*\*\*\*\* Real-time passive acoustic mapping of tissue ablation and drug delivery by ultrasound  
 Pr Constantin C. Coussios, Biomedical Ultrasound, Biophysics & Biopharmaceuticals Laboratory (BUBBL), Oxford
- 15:30 - 16:15 \*\*\*\*\* Biomimetic polymersomes, a promising platform towards personalized nanomedicine  
 Pr Sébastien Lecommandoux, Laboratoire de Chimie des Polymères Organiques, Bordeaux
- 16:15 - 17:00 \*\*\*\*\* Closing session

Translational Research and Advanced Imaging Laboratory

Conference

Mardi 23 Septembre 2014

**Lieu : Amphithéâtre de l'IECB**  
2 rue Robert Escarpit, 33607 Pessac

11h00 - 12h00 :

## One-step Kit-like Radiofluorination of Peptides and other large molecules

**David Perrin, Professor at Department of Chemistry, University of British Columbia, Vancouver, CANADA**

## One-step Kit-like Radiofluorination of Peptides and other large molecules

Peptides and other large molecules exhibit high specificity and high affinity for biological targets. When labeled with an appropriate PET isotope, they may be used as imaging agents to validate preclinical targets and guide clinical diagnoses. Of all the PET isotopes,  $^{18}\text{F}$ -fluoride is often preferred due to its moderate half-life and facile production at Curie levels in hospital cyclotrons. Yet fluoride is generally unreactive in water while peptides and other molecules generally require water. Typically radiosyntheses involve several steps that can take up to 3 hours. We have sought to develop a user-friendly aqueous one-step labeling method that uses organoboronates as captors of aqueous fluoride in order to enable a kit-like one-step aqueous  $^{18}\text{F}$ -labeling approach that can be generalized to labeling large biomolecules and to prepare dual-mode fluorescent PET tracers. Progress in this development will be discussed.

### David Perrin Research and Teaching Interests:

CATALYSIS AND MOLECULAR RECOGNITION APPLIED TO BIOLOGY RESEARCH THEME :

His research uses the tools of synthetic chemistry to address questions of molecular recognition and catalysis within a biologist setting, all the while maintaining medically relevant goals. He provides a comprehensive research program at the interface of chemistry and biology, and preliminary data for these projects have already appeared in peer reviewed journals.

Translational Research and Advanced Imaging Laboratory

Neuroimaging Conferences

Mercredi 21 Mai 2014

**Lieu : Centre de Génomique Fonctionnelle Bordeaux (CGFB)**  
Campus Carreire

9h30 - 10h30

### Neuroimaging at ultra high field

**Brian RUTT, Professor of Radiology**  
Stanford School of Medicine – CA, USA

10h30 - 11h30

### Diffusion MRI: From Diffusion to Brain connectomics

**Aurobrata GHOSH, Post Doctoral Researcher**  
Inria Sophia-Antipolis—Méditerranée – France

## Neuroimaging at Ultra high Field

### Brian RUTT

Ultra high field magnet (7 Tesla) for human exploration offers not only increased signal-to-noise ratio relative to 3T and lower field technologies, but also new contrast by virtue of modified relaxation times and dramatically increased susceptibility effects. Spectroscopic resolution and BOLD contrast are also improved at higher field. Nevertheless, to take advantage of this technology, several challenges of ultra high field need to be addressed such as increased  $B_0$  and  $B_1$  inhomogeneities and increased power deposited in subject. Solutions are being developed to mitigate these challenges and open the way to clinical applications especially in neurological disorders such as Alzheimer disease, multiple sclerosis, Parkinson disease or for planning deep brain stimulation procedures.

Brian Rutt joined the Stanford faculty as Professor of Radiology effective Jan. 1, 2009. Dr. Rutt, who is the author of more than 120 peer reviewed journal articles, is an internationally recognized expert in Magnetic Resonance Imaging (MRI). Prior to coming to Stanford, Dr. Rutt was Professor of Diagnostic Radiology and Nuclear Medicine and Medical Biophysics at the University of Western Ontario and the recipient of the Barnett-Lvey Heart and Stroke Foundation of Ontario Endowed.

## Diffusion MRI: From Diffusion to Brain connectomics

### Aurobrata GHOSH

Diffusion MRI (dMRI) is today a unique tool for inferring the microstructure of the CNS white-matter non-invasively and *in vivo*. It is the only method that allows an *in vivo* and non-invasive virtual dissection of the human brain to understand its connectivity (the human connectome) and to assess its integrity. Today, since a large population grows older and many pathologies are traced to disorders or degeneration of the cerebral white matter, dMRI is becoming invaluable for diagnosis and prognosis. In this talk I will cover the basic concepts of dMRI signal generation and a number of popularly used state-of-the-art models. This should give an idea of the possibilities that dMRI opens up and some directions for future research.

Dr. Ghosh has a PhD in Diffusion MRI from the Athena Project Team, Inria Sophia Antipolis – Méditerranée & Université de Nice. He has mainly worked on high order tensors and other functional bases (spherical harmonics, Hermite functions) for modelling and interpreting the diffusion MRI signal from HARDI acquisitions.

## MENTORING ACTIONS IN 2011

Mentoring Project	Project name	Project Leader	Team	Description	TRAIL grant	Number of participants	Partners
Thematic school	MODULOMAG: MRI contrast modulation	JM Franconi	UMR5536 (RMSB: Magnetic Resonance of Biological Systems Laboratory)	Installation of a thematic school on the topic: "contrast modulation as a MRI tool for the development of new diagnostic and therapeutic strategies".	23000€ (12000€ financed by TRAIL)	13	Mons University
Symposia	NGI: neuroglial interactions, from metabolism to activity	AK Bouzier-Sore		The goal of this symposia is to review some of the most exciting work that has been performed in this field of research, in the context of energy compartmentation, synaptic transmission and cognitive functions using various techniques such as 13C-NMR spectroscopy, immunochemistry, electrophysiology, cellular imaging, and to join top notch neuroscientists, spectroscopists, and clinicians working on neuron-glia interactions	7700 € (2400€ financed by TRAIL)	50	SFR neurosciences, SFR Tecsau, Aquitaine Region, Society of Neurosciences, BRAIN LabEx
International mobility	DIMI: New developments in myelin imaging with application to multiple sclerosis	T Tourdias	U862 (Magendie Institute)	We propose to develop, validate using direct histopathological correlation, and apply in a limited patient trial, a new quantitative, 3D whole-brain multi-component relaxometric MR imaging method for assessing myelin volume in multiple sclerosis (MS) patients (mcDESPOT) taking advantage of the higher magnetic fields, which are now available (3T and 7T). The potential impact of this development is major: if successful, it could represent the means to get past the present-day failure of MRI methods to accurately predict disease burden and ultimate outcome in MS patients with implication in the therapeutic strategy and clinical trials.	15000€ (5000€ financed by TRAIL)	1	Fundation of Bordeaux University

## DISSEMINATION ACTIONS

**CERVORAMA** ([http://www.cap-sciences.net/pageseditos,441,left\\_BC9263C5.html](http://www.cap-sciences.net/pageseditos,441,left_BC9263C5.html))

CERVORAMA was an exhibition organized by Cap Sciences Museum in Bordeaux showing how unique the brain is. Exhibition had 5 main themes: 1) comparing brain of animals and humans, 2) understanding cognitive functions, memory, plasticity 3) zooming into the brain using a 3D interactive presentation of its anatomy, 4) playing tricks to the brain, 5) discovering the cybernetic world.

"Chercheurs d'Aquitaine" is a magazine about research and researchers from Aquitaine; it is distributed in all major public libraries in Aquitaine. The number 5 of this magazine – published in 2013 – was fully dedicated to the presentation of Idex Bordeaux, the LabEx and their directors.

#### Portrait

Vincent DOUSSET

Une certaine image de la recherche

C'est un passionné de littérature : Marguerite Yourcenar, Primo Levi, Cioran, Fernando Pessoa, Kawabata, Hemingway, et bien d'autres. L'homme préhistorique est son modèle « pour ce que fut sa bataille à survivre. » Il aime donc la vie, l'Homo sapiens et la médecine. La médecine qu'il a choisie « par curiosité et par crainte de méconnaître les mécanismes de la vie et des maladies. » Mais il a pourtant longtemps hésité avec Sciences Po et le journalisme. Le professeur Vincent Dousset dirige le service de neuroradiologie diagnostique et thérapeutique au CHU de Bordeaux et le labex Trail (Translational Research and Advanced Imaging Laboratory). C'est au cours de son internat en radiologie qu'il rencontre l'imagerie par résonance magnétique, encore balbutiante, dans le service du professeur Jean-Marc Caillé. « Il occupait le bureau que j'occupe aujourd'hui, dit-il avec nostalgie. C'est lui qui m'a initié à la recherche clinique alors qu'à l'époque c'était presque mal vu de faire de la recherche à l'hôpital. » Le jeune radiologue part alors aux États-Unis comme research fellow à l'université de Pennsylvanie, dans le service du professeur Robert I. Grossman, neuro-imager et spécialiste mondial de neuro-imagerie. Cela confirme son attrance pour l'imagerie médicale et surtout pour la recherche qui canalise sa soif de curiosité. Mais pour progresser dans sa science comme dans la vie, le médecin a sa philosophie : « Il n'y a pas plus faux que la vérité et il faut surtout s'éloigner des détenteurs de vérité. J'aime l'incertitude. N'adhérer à rien de façon irréversible. Se laisser flotter. Cela suppose de maintenir la porte ouverte à l'autre. » La recherche en imagerie médicale ouvre justement la porte

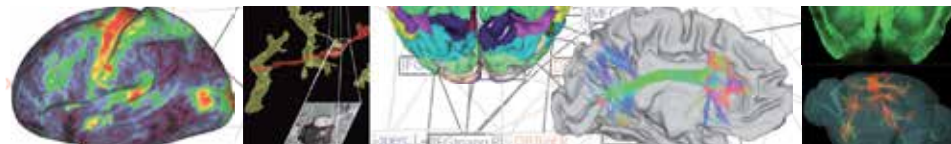

aux autres... Physiciens, biologistes, mathématiciens, informaticiens. C'est une recherche translationnelle qui s'exprime à travers les progrès fulgurants des scanners, IRM et autres technologies, rendant jour après jour le corps humain encore plus transparent. Durant les dix dernières années, Vincent Dousset a réussi à fédérer les forces de la bio-imagerie fonctionnelle bordelaise pour créer l'Institut de Bio-Imagerie en sciences médicales et emmener cet institut vers Trail. Le programme des investissements d'avenir va permettre aussi de faire entrer Bordeaux dans le club très fermé des six grandes plateformes nationales de bio-imagerie du vivant. Il ouvre également l'université à la compétition internationale dans le domaine. C'est d'ailleurs le développement de la notoriété internationale de l'université Bordeaux Segalen qui mobilise aujourd'hui une bonne partie de l'énergie de Vincent Dousset depuis qu'il s'est vu confier le poste de vice-président aux relations extérieures. « C'est un honneur de travailler auprès de la direction de Bordeaux Segalen, » dit-il, mais cela, regrette-t-il, l'amène cependant trop souvent bien loin des chemins de randonnée du Balaitous ou de l'Ossau, là où il puise régulièrement l'énergie de sa qualité première : l'humanisme.

Didier Dubrana

## CONNECTOMICS : THE WIRING DIAGRAM OF THE HUMAN BRAIN, SEPTEMBER 2014

<http://connectomics2014.u-bordeaux.fr/>

### CONNECTOMICS 2014 THE WIRING DIAGRAM OF THE HUMAN BRAIN

### 1<sup>st</sup> International Summer School September 22-26, 2014 - Bordeaux

A new discipline of modern neuroscience, the connectomic, examines the organization and functioning of the brain across all its anatomical and functional connections, namely the connectome. The understanding and optimal use of these methods require a multidisciplinary training for neuroscience researchers. This is the challenge of "CONNECTOMICS 2014", the first international summer school offering to the scientific community a state of the art of the advanced approaches currently used in determining the wiring diagram of the human brain, to deepen or to acquire new knowledge about a domain still not taught and booming: the human brain connectome.

#### Scientific committee

**Katrin Amunts**, Institute of Neurosci. and Medicine, Jülich, Germany; **Bernard Mazoyer**, Groupe d'Imagerie Neurofonctionnelle UMR5296, Bordeaux, France; **Christophe Mulle**, Interdisciplinary Institute of Neuroscience, UMR5297, Bordeaux, France; **Tomás Paus**, Rotman Research Institute, Baycrest Centre, Toronto, Canada; **Laurent PETIT**, Groupe d'Imagerie Neurofonctionnelle UMR5296, Bordeaux, France.

#### Audience

The school will welcome 50 researchers, engineers, post-docs and end-term PhD interested in the topic of the connectome.

#### Information and Registration

<http://connectomics2014.u-bordeaux.fr>  
deadline : 31<sup>st</sup> of July, 2014

Registration fees cover the courses, accommodation, coffee and lunch breaks.

500 € for researchers and engineers  
300 € for post-docs and PhD students

Note that CONNECTOMICS 2014 is a Thematic School of the CNRS allowing no fees for personal employed by the CNRS.

Please note that the registration is mandatory to validate your application. Once your application is completed and has been evaluated, the organizing committee will let you know the final decision. If you are selected, registration process should be finalized through the payment of fee.

#### Program

September, Monday 22nd PM

Opening lecture  
Connectome, connectomics: Origins by Olaf SPORNS

#### Microscopic structural connectome

- Neural circuit analysis with Brainbow by K. MATHO
- Activity-dependent labeling of memory engrams by S. RAMIREZ
- Advanced optical techniques for brain-wide imaging of neuronal activity by R. PREVEDEL

September, Tuesday 23rd

#### Microscopic structural connectome

- The secrets of neuronal circuits with recombinant rabies virus by A. FRICK
- Mapping synaptic function and connectivity in cortical cells by T. MARGRIE
- Optogenetic interrogation of valence circuits by A. BEYELER

#### Macroscopic structural connectome

- Connectomic approaches before connectome by M. THIEBAUT de SCHOTTEN
- The do's and don'ts of diffusion MRI by A. LEEMANS
- Advances in diffusion MRI acquisition and processing by S. SOTIROPOULOS
- Tractography with tractometer by G. GIRARD

September, Wednesday 24th

#### Macroscopic structural connectome

- dMRI in cortical gray matter and its validation with histology by A. ROEBROECK
- Tractography against dissection by S. SARUBBO
- Insight into the development and maturation of the brain by T. PAUS

#### White matter as transport system

- White matter as a transport system by T. PAUS
- Titled coming soon by R. PAUTLER
- Titled coming soon by G. MORFINI

#### Introduction to Allen Institute resources

- Advancing neuroscience with the Allen Brain Atlas by T. GILBERT

September, Thursday 25th

#### Intrinsic connectivity

- Studying large-scale brain networks: Electrical stimulation & neural-event-triggered fMRI by N. LOGOTHETIS
- Temporal dynamics of the resting-state signal by C. CHANG
- Graph analysis of the connectome by S. ACHARD
- Extrinsic/intrinsic modular organization of the connectome by G. DOUCET
- Modular structure of fMRI networks in resting-state by D. MEUNIER
- Relation between r-fMRI and t-fMRI connectomes by F. HOFFSTAEDTER
- Cerebral Cortex Connectomics by M. HELMSTAEDTER

September, Friday 26th AM

#### Databasing

- The Brain CONNECT project by Y. ASSAF
- The BIL&GIN project : Investigating asymmetries by B. MAZOYER
- Genetics of the Connectome and the ENIGMA Project by P. THOMPSON

université  
de BORDEAUX

All 40 participants (clinicians, engineers, researchers, post-doctoral and doctoral fellows) were very satisfied by the summerschool. Half of them answered a satisfaction survey and gave a global rate of "A" to the summerschool (courses, speakers, ambience, housing,...) and wish to participate to next edition.

## H2020 LifeKic Consortium

<http://ec.europa.eu/programmes/horizon2020/en/h2020-section/health-demographic-change-and-wellbeing>

Horizon 2020 is the financial instrument implementing the Innovation Union, a Europe 2020 flagship initiative aimed at securing Europe's global competitiveness. It is the biggest EU Research and Innovation programme ever with nearly €80 billion of funding available over 7 years (2014 to 2020), without counting the private investment that this money will attract. It promises to deliver more breakthroughs, discoveries and world-firsts by taking great ideas from lab to market. The programme has 7 main sections, among them the societal and "health, demographic change and wellbeing" challenges.

Responding to this challenge, research and innovation (R&I) under Horizon 2020 is an investment in better health for all. It aims to keep older people active and independent for longer and supports the development of new, safer and more effective interventions. R&I under Horizon 2020 also contributes to the sustainability of health and care systems.

University of Bordeaux participates with the "Région Aquitaine" to the LifeKic european consortium and will so participate to H2020 health calls organized by the European Institute of Innovation and Technology (EIT, <http://eit.europa.eu/>). Several health research projects from the University of Bordeaux have been selected to join the LifeKic research portfolio. For TRAIL, 11 projects have been chosen, because of their relevance with LifeKic strategy and H2020 health challenges:

# Annex 17

## Project of International Summerschool "Imaging of Neuroinflammation"

A 8 days program focused on the specificities of imaging neuroinflammatory disorders presented by renowned international speakers:

- › A unique approach: from cellular imaging, to pre-clinical imaging on animal models, to human imaging on patients. Courses and lectures will be mixed with practical sessions on up-to-date imaging equipments
- › A great location: the city of Bordeaux is on the world heritage list and the area has the largest and oldest fine wine vineyard in the world

### Presentation

Imaging tools are essential to better understand the multiple features of neuroinflammation, to diagnose, and they have strong impact to monitor the treatment of patients such as those affected by multiple sclerosis. A Large panel of imaging techniques is available at every spatial scales. They require specific skills and their application to neuroinflammation have several specificities. The University of Bordeaux gathers a unique scientific environment, technics and facilities, with world leader experts in microscopic imaging tools (LabEx BRAIN, D. Choquet) as well as in in vivo imaging in animals and humans (LabEx TRAIL, V. Dousset).

In this context, we plan to organize "2015 Summer School of Imaging in Neuroinflammation" in Bordeaux as part of the "International School of Neuroscience".

The main part of the course is practical: participants will learn how to set up an experiment, train on several scans and analyze images. The theoretical part will consist on courses, discussions and paper analysis presented by local and international experts.

The course will start from the single particle tracking of membrane molecules involved in inflammation. The photonic techniques to explore immune cell invasion and its consequences on tissue in vivo will be addressed. We will discuss the animal models of inflammation suitable for imaging and the in vivo imaging techniques used in animals. This course will provide a large view on the technical approach, practical issues and post treatment methods for large scale cohort analysis.

### Benefits

The theme is major: inflammation is encountered in many neurological disorders and imaging of neuro inflammation is crucial for several applications.

The approach is unique: the summerschool will cover a wide range of spatial scale from cellular imaging, to pre-clinical imaging on animal models, to human imaging on patients. Half of the course will be theoretical and half practical, giving access to up-to-date imaging equipments

Renowned international speakers

Attractive area: the city of Bordeaux is on the world heritage list and Bordeaux area has the largest and oldest fine wine vineyard in the world.
